ISSUE NOTIFICATION

The projected patent number and issue date are specified above.

Determination of Patent Term Adjustment under 35 U.S.C. 154 (b) (application filed on or after May 29, 2000)

The Patent Term Adjustment is 0 day(s). Any patent to issue from the above-identified application will include an indication of the adjustment on the front page.

If a Continued Prosecution Application (CPA) was filed in the above-identified application, the filing date that determines Patent Term Adjustment is the filing date of the most recent CPA.

Applicant will be able to obtain more detailed information by accessing the Patent Application Information Retrieval (PAIR) WEB site (<http://pair.uspto.gov>).

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (571)-272-7702. Questions relating to issue and publication fee payments should be directed to the Customer Service Center of the Office of Patent Publication at (571)-272-4200.

APPLICANT(s) (Please see PAIR WEB site <http://pair.uspto.gov> for additional applicants):

Adrian Sfarti, Cupertino, CA;

PART B - FEE(S) TRANSMITTAL

Complete and send this form, together with applicable fee(s), to: **Mail** Mail Stop ISSUE FEE
Commissioner for Patents
P.O. Box 1450
Alexandria, Virginia 22313-1450
or Fax (571)-273-2885

INSTRUCTIONS: This form should be used for transmitting the ISSUE FEE and PUBLICATION FEE (if required). Blocks 1 through 5 should be completed where appropriate. All further correspondence including the Patent, advance orders and notification of maintenance fees will be mailed to the current correspondence address as indicated unless corrected below or directed otherwise in Block 1, by (a) specifying a new correspondence address; and/or (b) indicating a separate "FEE ADDRESS" for maintenance fee notifications.

CURRENT CORRESPONDENCE ADDRESS (Note: Use Block 1 for any change of address)

57580 7590 01/05/2009

STRATEGIC PATENT GROUP, P.C.
P.O. BOX 1329
MOUNTAIN VIEW, CA 94042

Note: A certificate of mailing can only be used for domestic mailings of the Fee(s) Transmittal. This certificate cannot be used for any other accompanying papers. Each additional paper, such as an assignment or formal drawing, must have its own certificate of mailing or transmission.

Certificate of Mailing or Transmission

I hereby certify that this Fee(s) Transmittal is being deposited with the United States Postal Service with sufficient postage for first class mail in an envelope addressed to the Mail Stop ISSUE FEE address above, or being facsimile transmitted to the USPTO (571) 273-2885, on the date indicated below.

1. Change of correspondence address or indication of "Fee Address" (37 CFR 1.363).

- ☐ Change of correspondence address (or Change of Correspondence Address form PTO/SB/122) attached.
- ☐ "Fee Address" indication (or "Fee Address" Indication form PTO/SB/47; Rev 03-02 or more recent) attached. **Use of a Customer Number is required.**

2. For printing on the patent front page, list Strategic Patent Group, P.C.

- (1) the names of up to 3 registered patent attorneys or agents OR, alternatively, 1 _____
- (2) the name of a single firm (having as a member a registered attorney or agent) and the names of up to 2 registered patent attorneys or agents. If no name is listed, no name will be printed. 2 _____
- 3 _____

3. ASSIGNEE NAME AND RESIDENCE DATA TO BE PRINTED ON THE PATENT (print or type)

PLEASE NOTE: Unless an assignee is identified below, no assignee data will appear on the patent. If an assignee is identified below, the document has been filed for recordation as set forth in 37 CFR 3.11. Completion of this form is NOT a substitute for filing an assignment.

(A) NAME OF ASSIGNEE

(B) RESIDENCE: (CITY and STATE OR COUNTRY)

Please check the appropriate assignee category or categories (will not be printed on the patent): ☐ Individual ☐ Corporation or other private group entity ☐ Government

4a. The following fee(s) are submitted:

- ☒ Issue Fee
- ☒ Publication Fee (No small entity discount permitted)
- ☐ Advance Order - # of Copies _____

4b. Payment of Fee(s); (Please first reapply any previously paid issue fee shown above)

- ☐ A check is enclosed.
- ☒ Payment by credit card. Form PTO-2038 is attached. via EFS.
- ☐ The Director is hereby authorized to charge the required fee(s), any deficiency, or credit any overpayment, to Deposit Account Number _____ (enclose an extra copy of this form).

5. Change in Entity Status (from status indicated above)

- ☐ a. Applicant claims SMALL ENTITY status. See 37 CFR 1.27. ☐ b. Applicant is no longer claiming SMALL ENTITY status. See 37 CFR 1.27(g)(2).

NOTE: The Issue Fee and Publication Fee (if required) will not be accepted from anyone other than the applicant; a registered attorney or agent; or the assignee or other party in interest as shown by the records of the United States Patent and Trademark Office.

Authorized Signature /Stephen G. Sullivan/
Typed or printed name Stephen G. Sullivan

TITLE OF INVENTION: BICUBIC SURFACE REAL TIME TESSELATION UNIT

APPLN. TYPE	SMALL ENTITY	ISSUE FEE DUE	PUBLICATION FEE DUE	PREV. PAID ISSUE FEE	TOTAL FEE(S) DUE	DATE DUE
nonprovisional	YES	\$755	\$300	\$0	\$1055	04/06/2009

THE APPLICATION IDENTIFIED ABOVE HAS BEEN EXAMINED AND IS ALLOWED FOR ISSUANCE AS A PATENT. PROSECUTION ON THE MERITS IS CLOSED. THIS NOTICE OF ALLOWANCE IS NOT A GRANT OF PATENT RIGHTS. THIS APPLICATION IS SUBJECT TO WITHDRAWAL FROM ISSUE AT THE INITIATIVE OF THE OFFICE OR UPON PETITION BY THE APPLICANT. SEE 37 CFR 1.313 AND MPEP 1308.

THE ISSUE FEE AND PUBLICATION FEE (IF REQUIRED) MUST BE PAID WITHIN THREE MONTHS FROM THE MAILING DATE OF THIS NOTICE OR THIS APPLICATION SHALL BE REGARDED AS ABANDONED. THIS STATUTORY PERIOD CANNOT BE EXTENDED. SEE 35 U.S.C. 151. THE ISSUE FEE DUE INDICATED ABOVE DOES NOT REFLECT A CREDIT FOR ANY PREVIOUSLY PAID ISSUE FEE IN THIS APPLICATION. IF AN ISSUE FEE HAS PREVIOUSLY BEEN PAID IN THIS APPLICATION (AS SHOWN ABOVE), THE RETURN OF PART B OF THIS FORM WILL BE CONSIDERED A REQUEST TO REAPPLY THE PREVIOUSLY PAID ISSUE FEE TOWARD THE ISSUE FEE NOW DUE.

HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

If the SMALL ENTITY is shown as NO:

A. Pay TOTAL FEE(S) DUE shown above, or

B. If applicant claimed SMALL ENTITY status before, or is now claiming SMALL ENTITY status, check box 5a on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and 1/2 the ISSUE FEE shown above.

II. PART B - FEE(S) TRANSMITTAL, or its equivalent, must be completed and returned to the United States Patent and Trademark Office (USPTO) with your ISSUE FEE and PUBLICATION FEE (if required). If you are charging the fee(s) to your deposit account, section "4b" of Part B - Fee(s) Transmittal should be completed and an extra copy of the form should be submitted. If an equivalent of Part B is filed, a request to reapply a previously paid issue fee must be clearly made, and delays in processing may occur due to the difficulty in recognizing the paper as an equivalent of Part B.

III. All communications regarding this application must give the application number. Please direct all communications prior to issuance to Mail Stop ISSUE FEE unless advised to the contrary.

IMPORTANT REMINDER: Utility patents issuing on applications filed on or after Dec. 12, 1980 may require payment of maintenance fees. It is patentee's responsibility to ensure timely payment of maintenance fees when due.

PART B - FEE(S) TRANSMITTAL

**Complete and send this form, together with applicable fee(s), to: Mail Mail Stop ISSUE FEE
Commissioner for Patents
P.O. Box 1450
Alexandria, Virginia 22313-1450
or Fax (571)-273-2885**

INSTRUCTIONS: This form should be used for transmitting the ISSUE FEE and PUBLICATION FEE (if required). Blocks 1 through 5 should be completed where appropriate. All further correspondence including the Patent, advance orders and notification of maintenance fees will be mailed to the current correspondence address as indicated unless corrected below or directed otherwise in Block 1, by (a) specifying a new correspondence address; and/or (b) indicating a separate "FEE ADDRESS" for maintenance fee notifications.

CURRENT CORRESPONDENCE ADDRESS (Note: Use Block 1 for any change of address)

Note: A certificate of mailing can only be used for domestic mailings of the Fee(s) Transmittal. This certificate cannot be used for any other accompanying papers. Each additional paper, such as an assignment or formal drawing, must have its own certificate of mailing or transmission.

Determination of Patent Term Adjustment under 35 U.S.C. 154 (b) (application filed on or after May 29, 2000)

The Patent Term Adjustment to date is 0 day(s). If the issue fee is paid on the date that is three months after the mailing date of this notice and the patent issues on the Tuesday before the date that is 28 weeks (six and a half months) after the mailing date of this notice, the Patent Term Adjustment will be 0 day(s).

If a Continued Prosecution Application (CPA) was filed in the above-identified application, the filing date that determines Patent Term Adjustment is the filing date of the most recent CPA.

Applicant will be able to obtain more detailed information by accessing the Patent Application Information Retrieval (PAIR) WEB site (<http://pair.uspto.gov>).

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (571)-272-7702. Questions relating to issue and publication fee payments should be directed to the Customer Service Center of the Office of Patent Publication at 1-(888)-786-0101 or (571)-272-4200.

Notice of Allowability	Application No.	Applicant(s)

Interview Summary	Application No. 11/778,515	Applicant(s) SFARTI, ADRIAN	
	Examiner SAID BROOME	Art Unit 2628	

All participants (applicant, applicant's representative, PTO personnel):

(1) Said Broome. (3) ____.

(2) Stephen Sullivan. (4) ____.

Date of Interview: 29 December 2008.

Type: a) ☒ Telephonic b) ☐ Video Conference
c) ☐ Personal [copy given to: 1) ☐ applicant 2) ☐ applicant's representative]

Exhibit shown or demonstration conducted: d) ☐ Yes e) ☒ No.
If Yes, brief description: ____.

Claim(s) discussed: 19.

Identification of prior art discussed: N/A.

Agreement with respect to the claims f) ☒ was reached. g) ☐ was not reached. h) ☐ N/A.

Substance of Interview including description of the general nature of what was agreed to if an agreement was reached, or any other comments: Applicant's representative authorized examiner's amendment to enable the method of claim 19 to be tied to an apparatus in the body of the claim.

(A fuller description, if necessary, and a copy of the amendments which the examiner agreed would render the claims allowable, if available, must be attached. Also, where no copy of the amendments that would render the claims allowable is available, a summary thereof must be attached.)

THE FORMAL WRITTEN REPLY TO THE LAST OFFICE ACTION MUST INCLUDE THE SUBSTANCE OF THE INTERVIEW. (See MPEP Section 713.04). If a reply to the last Office action has already been filed, APPLICANT IS GIVEN A NON-EXTENDABLE PERIOD OF THE LONGER OF ONE MONTH OR THIRTY DAYS FROM THIS INTERVIEW DATE, OR THE MAILING DATE OF THIS INTERVIEW SUMMARY FORM, WHICHEVER IS LATER, TO FILE A STATEMENT OF THE SUBSTANCE OF THE INTERVIEW. See Summary of Record of Interview requirements on reverse side or on attached sheet.

/Said Broome/ Examiner, Art Unit 2628	
--	--

DETAILED ACTION

Response to Amendment

1. This office action is in response to an amendment filed on 11/6/2008.
2. Claims 1-10 have been cancelled by the applicant.
3. Claims 11-19 are original.

Examiner's Amendment

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Stephen Sullivan on December 29, 2008.

Amend the claims as follows:

Claim 19: In line 5 after the word "subdivision" insert the phrase "using the computer system".

Allowable Subject Matter

Claims 11-19 are allowed. The following is an examiner's statement of reasons for allowance:

The prior art references, Fenney et al. (U.S. Patent Publication 2004/0113909), Moreton et al. (U.S. Patent 6,906,716) and Oliver et al. (U.S. Patent 5,561,754), do not teach all the limitations of claims 11-19.

In regards to claim 11, the prior fails to teach or suggest a system, comprising a processor and a graphics processing unit (GPU) coupled to the processor, the GPU comprising a transform unit, a lighting unit, a renderer unit, and a tessellate unit coupled between the transform unit and the lighting unit, wherein objects to be rendered by the GPU are transmitted as control points to the GPU, the transform unit transforms the control points, the tessellate unit executes a first set of instructions for tessellating both rational and non-rational object surfaces expressed in screen coordinates (SC), in real-time, the lighting unit lights vertices of the triangles resultant from tessellation, and the renderer unit renders and displays the triangles by executing a second set of instructions, therefore claims 11-18 are allowable.

In regards to claim 19, the prior fails to teach or suggest a real-time method for tessellating and rendering surfaces of an object on a computer system, comprising (a) performing transformation and tessellation by, (i) for each surface, transforming 16 points, (ii) performing three dimensional surface subdivision using the computer system by subdividing only two cubic curves comprising the surface, (iii) terminating the subdivision termination by expressing the subdivision in screen coordinates (SC) and by measuring curvature in pixels, (iv) for each new view, generating a new subdivision, thereby producing automatic level of detail, (v) preventing cracks at boundaries between adjacent surfaces by using a common subdivision for all surfaces sharing a boundary, (vi) for the current subdivision, generating the vertices, normals, texture coordinates, and displacements used for bump and displacement mapping, and (vii) generating

Art Unit: 2628

triangles by connecting neighboring vertices, (viii) for each vertex, calculating the normal, calculating normal displacement for bump mapping, displacing the normal for bump mapping, displacing the vertex for displacement mapping, wherein bump and displacement mapping are executed pixel by pixel for all the points inside each triangle, and (ix) calculating the normal of each triangle; and (b) performing rendering by (i) for each triangle, clipping against a viewing viewport, calculating lighting for additional vertices produced by clipping, and culling backfacing triangles, (ii) projecting all vertices into screen coordinates, and (iii) rendering all the triangles produced after clipping and projection, therefore claim 19 is allowable.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to SAID BROOME whose telephone number is (571)272-2931.

The examiner can normally be reached on M-F 8:30am-5pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ulka Chauhan can be reached on (571)272-7782. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications

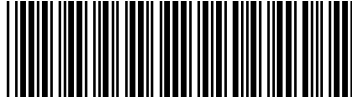

Art Unit: 2628

may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.

Filed: 7/16/2007	Examiner: Broome, Said A.
Title: BICUBIC SURFACE REAL TIME TESSELATION UNIT	Confirmation No: 1565

RESPONSE UNDER 37 CFR 1.111

Dear Sir:

In response to the Office Action of October 29, 2008, please amend the above-identified application in the following manner:

Amendments to the Claims are reflected in the listing of claims which begins on page 2 of this paper.

Remarks/Arguments begin on page 6 of this paper.

Amendments to the Claims:

This listing of claims will replace all prior version, and listings, of claims in the application.

Listing of Claims:

1 (Canceled)

2 (Canceled)

3 (Canceled)

4 (Canceled)

5 (Canceled)

6 (Canceled)

7 (Canceled)

8 (Canceled)

9 (Canceled)

10 (Canceled)

11 (Previously Presented) A system, comprising:

a processor; and

a graphics processing unit (GPU) coupled to the processor, the GPU comprising a transform unit, a lighting unit, a renderer unit, and a tessellate unit coupled between the transform unit and the lighting unit;

wherein objects to be rendered by the GPU are transmitted as control points to the GPU, the transform unit transforms the control points, the tessellate unit executes a first set of instructions for tessellating both rational and non-rational object surfaces expressed in screen coordinates (SC), in real-time, the lighting unit lights vertices of the triangles resultant from tessellation, and the renderer unit renders and displays the triangles by executing a second set of instructions.

12 (Original) The graphics system of claim 11 wherein the first set of instructions simplifies three dimensional surface subdivision of the object surfaces by reducing surface subdivision to a subdivision of two cubic curves by performing instructions for:
for each bicubic surface,

subdividing a boundary curve representing an s interval until a projection of a length of a height of a curve bounding box is below a certain predetermined number of pixels as measured in screen coordinates; and

subdividing the boundary curve representing a t interval until a projection of a length of a height of the curve bounding box is below a certain predetermined number of pixels as measured in screen coordinates.

13 (Original) The graphics system of claim 12 wherein the first set of instructions simplifies three dimensional surface subdivision by reducing it to the subdivision of two cubic curves by simplifying subdivision termination criteria by expressing the termination criteria in screen (SC) coordinates and by measuring curvature in pixels, wherein for each new view, a new subdivision can be generated, producing automatic level of detail.

14 (Original) The graphics system of claim 13 wherein the first set of instructions reduces cracks at the boundaries between surfaces by using a common subdivision for all surfaces sharing a boundary by performing instructions for:

for all bicubic surfaces sharing a same s or t parameter boundary,

choosing as a common subdivision a reunion of the subdivisions in order to prevent cracks showing along the common boundary or a finest subdivision, the finest subdivision being the one with the most points inside the set.

15 (Previously Presented) The graphics system of claim 14 wherein the first set of instructions generates vertices, normals, texture coordinates, and displacements used for bump and displacement mapping are generated by performing instructions for:

for each bicubic surface,

for each pair (s_i, t_j) of parameters, where i and j represent a number of rows and columns, respectively,

calculating texture coordinates $((u_{i,j}, v_{i,j}, q_{i,j}))$ and displacement coordinates $(p_{i,j}, r_{i,j})$ for vertex $V_{i,j}$ thru interpolation,

looking up vertex displacement $(dx_{i,j}, dy_{i,j}, dz_{i,j})$ corresponding to the displacement coordinates $(p_{i,j}, r_{i,j})$; and

generating triangles by connecting neighboring vertices.

16 (Original) The graphics system of claim 15 wherein the second set of instructions generates vertices, normals, texture coordinates, and displacements used for bump and displacement mapping by performing instructions for:

for each vertex $V_{i,j}$,

calculating a normal $N_{i,j}$ to that vertex, which was previously transformed in world coordinates

calculating $(dN_{i,j})$ as normal displacement for bump mapping as a function of (s_i, t_j) ;

calculating $N'_{i,j} = N_{i,j} + dN_{i,j}$ to displace the normal for bump mapping; and

calculating $V'_{i,j} = V_{i,j} + (dx_{i,j}, dy_{i,j}, dz_{i,j}) * N_{i,j}$ to displace the vertex for displacement mapping;

for each triangle,

executing bump and displacement mapping pixel-by-pixel for all the points inside the triangle; and

calculating a normal to the triangle for culling.

17 (Original) The graphics system of claim 11 further including a Graphics Utility Library (GLU) for implementing drivers.

- 18 (Original) The graphics system of claim 17 wherein the GLU includes several different types of primitives including, strips, fans, meshes, and indexed meshes of surface patches.
- 19 (Original) A real-time method for tessellating and rendering surfaces of an object on a computer system, comprising:
- (a) performing transformation and tessellation by,
 - (i) for each surface, transforming 16 points;
 - (ii) performing three dimensional surface subdivision by subdividing only two cubic curves comprising the surface;
 - (iii) terminating the subdivision termination by expressing the subdivision in screen coordinates (SC) and by measuring curvature in pixels;
 - (iv) for each new view, generating a new subdivision, thereby producing automatic level of detail;
 - (v) preventing cracks at boundaries between adjacent surfaces by using a common subdivision for all surfaces sharing a boundary;
 - (vi) for the current subdivision, generating the vertices, normals, texture coordinates, and displacements used for bump and displacement mapping; and
 - (vii) generating triangles by connecting neighboring vertices;
 - (viii) for each vertex, calculating the normal, calculating normal displacement for bump mapping, displacing the normal for bump mapping, displacing the vertex for displacement mapping, wherein bump and displacement mapping are executed pixel by pixel for all the points inside each triangle; and
 - (ix) calculating the normal of each triangle; and
 - (b) performing rendering by
 - (i) for each triangle, clipping against a viewing viewport, calculating lighting for additional vertices produced by clipping, and culling backfacing triangles;
 - (ii) projecting all vertices into screen coordinates; and
 - (iii) rendering all the triangles produced after clipping and projection.

REMARKS/ARGUMENTS

This Amendment is in response to the Office Action dated October 29, 2008. Claims 1-19 are pending. Claims 1-10 are rejected, and claims 11-19 are allowed. Claims 1-10 have been canceled. Accordingly, claims 11-19 remain pending in the present application.

In view of the foregoing, Applicant respectfully requests reconsideration and passage to issue of claims now presented. Applicants' attorney believes this application in condition for allowance. Should any unresolved issues remain, Examiner is invited to call Applicants' attorney at the telephone number indicated below.

Respectfully submitted,

Strategic Patent Group, P.C.

EXAMINER

BROOME, SAID A

ART UNIT

PAPER NUMBER

2628

MAIL DATE

DELIVERY MODE

10/29/2008

PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No.		Applicant(s)	
	11/778,515		SFARTI, ADRIAN	
	Examiner		Art Unit	
	SAID BROOME		2628	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 06 October 2008.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-19 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☒ Claim(s) 11-19 is/are allowed.
- 6) ☒ Claim(s) 1-10 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Response to Amendment

1. This office action is in response to an amendment filed on 10/6/2008.
2. Claims 6, 11 and 15 have been amended by the applicant.
3. Claims 1-5, 7-10, 12-14 and 16-19 are original.

Double Patenting

A rejection based on double patenting of the "same invention" type finds its support in the language of 35 U.S.C. 101 which states that "whoever invents or discovers any new and useful process ... may obtain a patent therefor ..." (Emphasis added). Thus, the term "same invention," in this context, means an invention drawn to identical subject matter. See *Miller v. Eagle Mfg. Co.*, 151 U.S. 186 (1894); *In re Ockert*, 245 F.2d 467, 114 USPQ 330 (CCPA 1957); and *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970).

A statutory type (35 U.S.C. 101) double patenting rejection can be overcome by canceling or amending the conflicting claims so they are no longer coextensive in scope. The filing of a terminal disclaimer cannot overcome a double patenting rejection based upon 35 U.S.C. 101.

Claims 1-10 of the current application 11/778,515 are rejected under 35 U.S.C. 101 as claiming the same invention as that of claims 1-10 of prior U.S. Patent No. 7,245,299, this is a double patenting rejection. Though the preamble of claim 1 recited in the current application 11/778,515 is a slight variation of claim 1 of U.S. Patent 7,245,299, the preamble is not given patentable weight since it is not tied to the body of the claim and is not required to breathe life in

Art Unit: 2628

to the invention, therefore the method steps of claim 1 the current application 11/778,515 and claim 1 of U.S. Patent 7,245,299 are rejected under a statutory type double patenting rejection.

Table I listed below is provided to show which claims in the current application, 11/778,515, map to claims of U.S. Patent 7,245,299. Table II is provided below to show how all the claimed limitations from the independent claim 1 of the current application 11/778,515 maps to the independent claim 1 of U.S. Patent 7,245,299.

TABLE I

Current Application: 11/778,515	Claims 1-10
U.S. Patent: 7,245,299	Claims 1-10

TABLE II

Current Application: 11/778,515 (Claim 1)	U.S. Patent: 7,245,299 (Claim 1)
1. A graphics processing unit for rendering objects from a software application executing on a processing unit in which the objects to be rendered are received as control points of bicubic surfaces, the graphics processing unit comprising:	1. A graphics processing unit for rendering objects from a software application executing on a processing unit in which the objects to be rendered are transmitted to the graphics processing unit over a bus as control points of bicubic surfaces, the graphics processing unit comprising:
a transform unit; a lighting unit; a renderer unit; and	a transform unit; a lighting unit; a renderer unit; and
a tessellate unit coupled between the	a tessellate unit coupled between the

transform unit and the lighting unit for tessellating both rational and non-rational object surfaces in real-time.	transform unit and the lighting unit for tessellating both rational and non-rational object surfaces in real-time.
--	--

Allowable Subject Matter

Claims 11-19 are allowed. The following is an examiner's statement of reasons for allowance:

The prior art references, Fenney et al. (U.S. Patent Publication 2004/0113909), Moreton et al. (U.S. Patent 6,906,716) and Oliver et al. (U.S. Patent 5,561,754), do not teach all the limitations of claims 11-19.

In regards to claim 11, the prior fails to teach or suggest a system, comprising a processor and a graphics processing unit (GPU) coupled to the processor, the GPU comprising a transform unit, a lighting unit, a renderer unit, and a tessellate unit coupled between the transform unit and the lighting unit, wherein objects to be rendered t-e-by the GPU are transmitted as control points to the GPU, the transform unit transforms the control points, the tessellate unit executes a first set of instructions for tessellating both rational and non-rational object surfaces expressed in screen coordinates (SC), in real-time, the lighting unit lights vertices of the triangles resultant from tessellation, and the renderer unit renders and displays the triangles by executing a second set of instructions, therefore claims 11-18 are allowable.

In regards to claim 19, the prior fails to teach or suggest a real-time method for tessellating and rendering surfaces of an object on a computer system, comprising (a) performing

Art Unit: 2628

transformation and tessellation by, (i) for each surface, transforming 16 points, (ii) performing three dimensional surface subdivision by subdividing only two cubic curves comprising the surface, (iii) terminating the subdivision termination by expressing the subdivision in screen coordinates (SC) and by measuring curvature in pixels, (iv) for each new view, generating a new subdivision, thereby producing automatic level of detail, (v) preventing cracks at boundaries between adjacent surfaces by using a common subdivision for all surfaces sharing a boundary, (vi) for the current subdivision, generating the vertices, normals, texture coordinates, and displacements used for bump and displacement mapping, and (vii) generating triangles by connecting neighboring vertices, (viii) for each vertex, calculating the normal, calculating normal displacement for bump mapping, displacing the normal for bump mapping, displacing the vertex for displacement mapping, wherein bump and displacement mapping are executed pixel by pixel for all the points inside each triangle, and (ix) calculating the normal of each triangle; and (b) performing rendering by (i) for each triangle, clipping against a viewing viewport, calculating lighting for additional vertices produced by clipping, and culling backfacing triangles, (ii) projecting all vertices into screen coordinates, and (iii) rendering all the triangles produced after clipping and projection, therefore claim 19 is allowable.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled “Comments on Statement of Reasons for Allowance.”

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. The prior art patents and non-patent literature on the attached PTO-892 form pertain to subdivision surfaces:

- Kumar, S., Manocha, D., Interactive Display of Large NURBS Models, December 1996, IEEE Transactions on Visualization and Computer Graphics, Vol. 2, No. 4, pp. 323-336.
- Snyder, J., Barr, A., Ray Tracing Complex Models Containing Surface Tessellations, July 1987, Proceedings of the 14th annual conference on Computer graphics and interactive techniques, Vol. 21, No. 4, p. 119-128.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to SAID BROOME whose telephone number is (571)272-2931. The examiner can normally be reached on M-F 8:30am-5pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ulka Chauhan can be reached on (571)272-7782. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would

RESPONSE UNDER 37 CFR 1.111

Dear Sir:

In response to the Office Action of July 15, 2008, please amend the above-identified application in the following manner:

Amendments to the Specification begin on page 2 of this paper.

Amendments to the Claims are reflected in the listing of claims which begins on page 4 of this paper.

Remarks/Arguments begin on page 10 of this paper.

Amendments to the Specification:

Please amend the paragraph starting on page 1, line 4, as follows:

The present invention is a continuation of U.S. ~~application serial number 10/732,398~~ Patent No. 7,245,299, entitled "Bicubic Surface Real-Time Tessellation Unit", (1935CIP2) ~~filed on December 9, 2003~~ issued on July 17, 2007, which is a continuation-in-part of abandoned U.S. application serial number 10/436,698, entitled "Bicubic Surface Rendering," (1935CIP) filed on May 12, 2003, which is a continuation-in-part of U.S. Patent No. 6,563,501 entitled "Bicubic Surface Rendering," issued May 13, 2003, which claims priority of provisional application 60/222,105, filed on July 28, 2000, which are hereby incorporated by reference.

Please amend the paragraph starting on page 2, line 12, as follows:

Figs. 1A and 1B are diagrams illustrating a process for rendering bicubic surfaces. As shown in Figure 1A, the principle used for rendering such a curved surface 10 is to subdivide it into smaller four sided surfaces or tiles 12 by subdividing the intervals that define the parameters s and t . The subdivision continues until the surfaces resulting from subdivision have a curvature, measured in WC space that is below a predetermined threshold. The subdivision of the intervals defining s and t produces a set of numbers $\{s_i\}$ where the indexes i and j represent the number of rows and columns in the resulting subdivision, $i=1,n$ and $\{t_j\}$ $j=1,m$ that determine a subdivision of the PC. This subdivision induces a subdivision of the TC, for each pair of parameters (s_i, t_j) we obtain a pair $(u_{i,j}, v_{i,j})$ (or a triplet $(u_{i,j}, v_{i,j}, q_{i,j})$). Here $u_{i,j}=a(s_i, t_j)$, $v_{i,j}=b(s_i, t_j)$, $q_{i,j}=c(s_i, t_j)$ represent texture coordinates. For each pair (s_i, t_j) we also obtain a Cartesian point (called "vertex") in WC, $V_{i,j}(f(s_i, t_j), g(s_i, t_j), h(s_i, t_j))$. A special type of texture, called displacement map having the pair (p, r) as coordinates can be used to generate special lighting effects. For each pair of parameters (s_i, t_j) we also obtain an index pair $(p_{i,j}, r_{i,j})$ that index a displacement value $(dx_{i,j}, dy_{i,j}, dz_{i,j})$ for the vertex $V_{i,j}$.

Please amend the paragraphs on page 10, lines 6-10, as follows:

For each pair (s_i, t_j) of parameters /*All calculations employ some form of direct

evaluation of the variables. Here, i and j represent a number of rows and columns, respectively */

Calculate (texture coordinates ($u_{i,j}$ $v_{i,j}$ $q_{i,j}$) and displacement coordinates ($p_{i,j}$ $r_{i,j}$) for vertex $V_{i,j}$) thru interpolation

/*texture -, displacement map and vertex coordinates as a function of (s_i, t_j)*/*

Look up vertex displacement ($dx_{i,j}$, $dy_{i,j}$, $dz_{i,j}$) corresponding to the displacement coordinates ($p_{i,j}$ $r_{i,j}$)

Amendments to the Claims:

This listing of claims will replace all prior version, and listings, of claims in the application.

Listing of Claims:

- 1 (Original) A graphics processing unit for rendering objects from a software application executing on a processing unit in which the objects to be rendered are received as control points of bicubic surfaces, the graphics processing unit comprising:
 - a transform unit;
 - a lighting unit;
 - a renderer unit; and
 - a tessellate unit coupled between the transform unit and the lighting unit for tessellating both rational and non-rational object surfaces in real-time.
- 2 (Original) The graphics processing unit of claim 1 wherein the transform unit transforms the control points, the tessellate unit tessellates the surfaces into triangles by executing a first set of instructions, the lighting unit lights vertices of the triangles, and the renderer unit renders the triangles by executing a second set of instructions.
- 3 (Original) The graphics processing unit of claim 2 wherein the first set of instructions simplifies three dimensional surface subdivision of the object surfaces by reducing surface subdivision to a subdivision of two cubic curves by performing instructions for:
 - for each bicubic surface,
 - subdividing a boundary curve representing an s interval until a projection of a length of a height of a curve bounding box is below a certain predetermined number of pixels as measured in screen coordinates; and
 - subdividing the boundary curve representing a t interval until a projection of a length of a height of the curve bounding box is below a certain predetermined number of pixels as measured in screen coordinates.
- 4 (Original) The graphics processing unit of claim 3 wherein the first set of instructions

simplifies three dimensional surface subdivision by reducing it to the subdivision of two cubic curves by simplifying subdivision termination criteria by expressing the termination criteria in screen (SC) coordinates and by measuring curvature in pixels, wherein for each new view, a new subdivision can be generated, producing automatic level of detail.

- 5 (Original) The graphics processing unit of claim 4 wherein the first set of instructions reduces cracks at the boundaries between surfaces by using a common subdivision for all surfaces sharing a boundary by performing instructions for:

for all bicubic surfaces sharing a same s or t parameter boundary,
choosing as a common subdivision a reunion of the subdivisions in order to prevent cracks showing along the common boundary or a finest subdivision, the finest subdivision being the one with the most points inside the set.

- 6 (Currently Amended) The graphics processing unit of claim 5 wherein the first set of instructions generates vertices, normals, texture coordinates, and displacements used for bump and displacement mapping are generated by performing instructions for:

for each bicubic surface,

for each pair (s_i, t_j) of parameters, where i and j represent a number of rows and columns, respectively,

calculating texture coordinates $((u_{i,j}, v_{i,j}, q_{i,j})$ and displacement coordinates $(p_{i,j}, r_{i,j})$ for vertex $V_{i,j}$ thru interpolation,

looking up vertex displacement $(dx_{i,j}, dy_{i,j}, dz_{i,j})$ corresponding to the displacement coordinates $(p_{i,j}, r_{i,j})$; and

generating triangles by connecting neighboring vertices.

- 7 (Original) The graphics processing unit of claim 6 wherein the second set of instructions generates vertices, normals, texture coordinates, and displacements used for bump and displacement mapping by performing instructions for:

for each vertex $V_{i,j}$,

calculating a normal $N_{i,j}$ to that vertex, which was previously transformed in world coordinates

calculating $(dN_{i,j})$ as normal displacement for bump mapping as a function of (s_i, t_j) ;

calculating $N'_{i,j} = N_{i,j} + dN_{i,j}$ to displace the normal for bump mapping; and

calculating $V'_{i,j} = V_{i,j} + (dx_{i,j}, dy_{i,j}, dz_{i,j}) * N_{i,j}$ to displace the vertex for displacement mapping;

for each triangle,

executing bump and displacement mapping pixel-by-pixel for all the points inside the triangle; and

calculating a normal to the triangle for culling.

8 (Original) The graphics processing unit of claim 1 wherein the tessellate unit is combined with the transform unit and the lighting unit.

9 (Original) The graphics processing unit of claim 1 further including a Graphics Utility Library (GLU) for implementing drivers.

10 (Original) The graphics processing unit of claim 9 wherein the GLU includes several different types of primitives including, strips, fans, meshes, and indexed meshes of surface patches.

11 (Currently Amended) A system, comprising:

a processor; and

a graphics processing unit (GPU) coupled to the processor, the GPU comprising a transform unit, a lighting unit, a renderer unit, and a tessellate unit coupled between the transform unit and the lighting unit;

wherein ~~the processor transmits~~ objects to be rendered ~~to~~ by the GPU are transmitted as control points to the GPU, the transform unit transforms the control points, the tessellate unit executes a first set of instructions for tessellating both rational and non-rational object surfaces expressed in screen coordinates (SC), in real-time, the lighting unit lights vertices of the triangles resultant from tessellation, and the renderer unit renders and displays the triangles by executing a second set of instructions.

12 (Original) The graphics system of claim 11 wherein the first set of instructions simplifies

three dimensional surface subdivision of the object surfaces by reducing surface subdivision to a subdivision of two cubic curves by performing instructions for:

for each bicubic surface,

subdividing a boundary curve representing an s interval until a projection of a length of a height of a curve bounding box is below a certain predetermined number of pixels as measured in screen coordinates; and

subdividing the boundary curve representing a t interval until a projection of a length of a height of the curve bounding box is below a certain predetermined number of pixels as measured in screen coordinates.

13 (Original) The graphics system of claim 12 wherein the first set of instructions simplifies three dimensional surface subdivision by reducing it to the subdivision of two cubic curves by simplifying subdivision termination criteria by expressing the termination criteria in screen (SC) coordinates and by measuring curvature in pixels, wherein for each new view, a new subdivision can be generated, producing automatic level of detail.

14 (Original) The graphics system of claim 13 wherein the first set of instructions reduces cracks at the boundaries between surfaces by using a common subdivision for all surfaces sharing a boundary by performing instructions for:

for all bicubic surfaces sharing a same s or t parameter boundary,

choosing as a common subdivision a reunion of the subdivisions in order to prevent cracks showing along the common boundary or a finest subdivision, the finest subdivision being the one with the most points inside the set.

15 (Currently Amended) The graphics system of claim 14 wherein the first set of instructions generates vertices, normals, texture coordinates, and displacements used for bump and displacement mapping are generated by performing instructions for:

for each bicubic surface,

for each pair (si,tj) of parameters, where i and j represent a number of rows and columns, respectively,

calculating texture coordinates $((u_{i,j} \ v_{i,j} \ q_{i,j})$ and displacement coordinates $(p_{i,j} \ r_{i,j})$ for vertex $V_{i,j})$ thru interpolation,
looking up vertex displacement $(dx_{i,j}, dy_{i,j}, dz_{i,j})$ corresponding to the displacement coordinates $(p_{i,j} \ r_{i,j})$; and
generating triangles by connecting neighboring vertices.

16 (Original) The graphics system of claim 15 wherein the second set of instructions generates vertices, normals, texture coordinates, and displacements used for bump and displacement mapping by performing instructions for:

for each vertex $V_{i,j}$,

calculating a normal $N_{i,j}$ to that vertex, which was previously transformed in world coordinates

calculating $(dN_{i,j})$ as normal displacement for bump mapping as a function of (s_i, t_j) ;

calculating $N'_{i,j} = N_{i,j} + dN_{i,j}$ to displace the normal for bump mapping; and

calculating $V'_{i,j} = V_{i,j} + (dx_{i,j}, dy_{i,j}, dz_{i,j}) * N_{i,j}$ to displace the vertex for displacement mapping;

for each triangle,

executing bump and displacement mapping pixel-by-pixel for all the points inside the triangle; and

calculating a normal to the triangle for culling.

17 (Original) The graphics system of claim 11 further including a Graphics Utility Library (GLU) for implementing drivers.

18 (Original) The graphics system of claim 17 wherein the GLU includes several different types of primitives including, strips, fans, meshes, and indexed meshes of surface patches.

19 (Original) A real-time method for tessellating and rendering surfaces of an object on a computer system, comprising:

(a) performing transformation and tessellation by,

- (i) for each surface, transforming 16 points;
- (ii) performing three dimensional surface subdivision by subdividing only two cubic curves comprising the surface;
- (iii) terminating the subdivision termination by expressing the subdivision in screen coordinates (SC) and by measuring curvature in pixels;
- (iv) for each new view, generating a new subdivision, thereby producing automatic level of detail;
- (v) preventing cracks at boundaries between adjacent surfaces by using a common subdivision for all surfaces sharing a boundary;
- (vi) for the current subdivision, generating the vertices, normals, texture coordinates, and displacements used for bump and displacement mapping; and
- (vii) generating triangles by connecting neighboring vertices;
- (viii) for each vertex, calculating the normal, calculating normal displacement for bump mapping, displacing the normal for bump mapping, displacing the vertex for displacement mapping, wherein bump and displacement mapping are executed pixel by pixel for all the points inside each triangle; and
- (ix) calculating the normal of each triangle; and
- (b) performing rendering by
 - (i) for each triangle, clipping against a viewing viewport, calculating lighting for additional vertices produced by clipping, and culling backfacing triangles;
 - (ii) projecting all vertices into screen coordinates; and
 - (iii) rendering all the triangles produced after clipping and projection.

REMARKS/ARGUMENTS

This Amendment is in response to the Office Action dated July 15, 2008. Claims 1-19 are pending. Claims 1-19 are rejected. Claims 6, 11, and 15 have been amended. Accordingly, claims 1-19 remain pending in the present application.

The Specification has been amended to provide patent numbers and issue dates for cross-referenced applications.

§112 Rejection Overcome

The Examiner rejected claims 6, 7, 15 and 16 under 35 USC §112, second paragraph, as being indefinite, for failing to provide language “to clearly define” symbols recited in claims.

In response, both the Specification on pages 2 and 10, and claims 6 and 15 have been amended to provide definitions for the recited symbols. Both the Specification and claims 6 and 15 now make clear that “i and j” represent a number of rows and columns, respectively”, $(u_{i,j} \ v_{i,j} \ q_{i,j})$ represent texture coordinates, $(p_{i,j} \ r_{i,j})$ represent displacement coordinates, and $V_{i,j}$ is a vertex. Support for the amendments may be found in the specification at least on page 2, lines 6-24 and page 10, lines 3-24. These amendments are seen by Applicant as broadening or cosmetic, and as such, is not subject to the prosecution history estoppel imposed by Festo. For the record, Applicant points out that the Supreme Court in Festo noted that a cosmetic amendment would not narrow the patent’s scope and thus would not raise the estoppel bar. Accordingly, the rejection under 35 USC §112 has been overcome.

Double Patenting Rejection Overcome

The Examiner rejected claims 11-18 of the current application 11/770 515 under 35 USC §101 over prior US Patent No. 7,245,299 for double patenting. In response, claim 11

has been amended. Claim 11 has been amended to recite “objects to be rendered by the GPU are transmitted as control points to the GPU,” rather than the processor transmits the objects. Claim 11 has also been amended to recite that the rational and non-rational object surfaces are “expressed in screen coordinates (SC)”, the vertices of the triangles are “resultant from tessellation”, and that the renderer unit renders “and displays” the triangles. As claim 11 has been amended and is no longer coextensive in scope with prior US Patent No. 7,245,299, the double patenting rejection has been overcome.

Claims 1-10 and 19 are rejected on the grounds of non-statutory obviousness-double patenting is being unpatentable over the claims of US Patent No. 7,245,299. In response, a terminal disclaimer compliance with 37 CFR 1.312 (c) is filed herewith. US Patent No. 7,245,299 is commonly owned with the present application.

In view of the foregoing, it is submitted that claims 1-19 are allowable. Accordingly, Applicant respectfully requests reconsideration and passage to issue of claims 1-19 as now presented. Should any unresolved issues remain, Examiner is invited to call Applicants' attorney at the telephone number indicated below.

Respectfully submitted,

/Stephen G. Sullivan/

**TERMINAL DISCLAIMER TO OBVIATE A DOUBLE PATENTING
REJECTION OVER A "PRIOR" PATENT**

Docket Number (Optional)
1935CIP2C

In re Application of: Sfarti

Application No.: 11/778,515

Filed: 7/16/2007

For: BICUBIC SURFACE REAL TIME TESSELATION UNIT

The owner*, Adrian Sfarti, of 100 percent interest in the instant application hereby disclaims, except as provided below, the terminal part of the statutory term of any patent granted on the instant application which would extend beyond the expiration date of the full statutory term **prior patent** No. 7,245,299 as the term of said prior patent is defined in 35 U.S.C. 154 and 173, and as the term of said **prior patent** is presently shortened by any terminal disclaimer. The owner hereby agrees that any patent so granted on the instant application shall be enforceable only for and during such period that it and the **prior patent** are commonly owned. This agreement runs with any patent granted on the instant application and is binding upon the grantee, its successors or assigns.

In making the above disclaimer, the owner does not disclaim the terminal part of the term of any patent granted on the instant application that would extend to the expiration date of the full statutory term as defined in 35 U.S.C. 154 and 173 of the **prior patent**, "as the term of said **prior patent** is presently shortened by any terminal disclaimer," in the event that said **prior patent** later:

- expires for failure to pay a maintenance fee;
- is held unenforceable;
- is found invalid by a court of competent jurisdiction;
- is statutorily disclaimed in whole or terminally disclaimed under 37 CFR 1.321;
- has all claims canceled by a reexamination certificate;
- is reissued; or
- is in any manner terminated prior to the expiration of its full statutory term as presently shortened by any terminal disclaimer.

Check either box 1 or 2 below, if appropriate.

1. ☐ For submissions on behalf of a business/organization (e.g., corporation, partnership, university, government agency, etc.), the undersigned is empowered to act on behalf of the business/organization.

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 11/778,515	Applicant(s) SFARTI, ADRIAN	
	Examiner SAID BROOME	Art Unit 2628	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 16 July 2007.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-19 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-19 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on _____ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some * c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
 2. ☐ Certified copies of the priority documents have been received in Application No. _____.
 3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION***Claim Rejections - 35 USC § 112***

The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 6, 7, 15 and 16 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. Claims 6 and 15 contain the symbols 'u_{ij}', 'v_{ij}', 'q_{ij}', 'p_{ij}', 'r_{ij}' and 'V_{ij}', which each contain the symbols 'i' and 'j', however no language has been provided to clearly define the symbols 'u', 'v', 'q', 'p', 'r', 'V', 'i' and 'j' recited in lines 5-8 of claims 6 and 15 respectively.

Double Patenting

A rejection based on double patenting of the "same invention" type finds its support in the language of 35 U.S.C. 101 which states that "whoever invents or discovers any new and useful process ... may obtain a patent therefor ..." (Emphasis added). Thus, the term "same invention," in this context, means an invention drawn to identical subject matter. See *Miller v. Eagle Mfg. Co.*, 151 U.S. 186 (1894); *In re Ockert*, 245 F.2d 467, 114 USPQ 330 (CCPA 1957); and *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970).

A statutory type (35 U.S.C. 101) double patenting rejection can be overcome by canceling or amending the conflicting claims so they are no longer coextensive in scope. The filing of a terminal disclaimer cannot overcome a double patenting rejection based upon 35 U.S.C. 101.

Claims 11-18 of the current application 11/778515 is rejected under 35 U.S.C. 101 as claiming the same invention as that of claims 11-18 of prior U.S. Patent No. 7,245,299, this is a double patenting rejection. Table I-A listed below is provided to show which claims in the current application, 11/778,515, map to claims of U.S. Patent 7,245,299. Table II-A is provided below to show how all the claimed limitations from the independent claim 11 of the current application 11/778,515 maps to the independent claim 11 of U.S. Patent 7,245,299.

TABLE 1-A

Current Application: 11/778,515	Claims 11-18
U.S. Patent: 7,245,299	Claims 11-18

TABLE II-A

Current Application: 11/778,515 (Claim 11)	U.S. Patent: 7,245,299 (Claim 11)
11. A system, comprising: a processor; and a graphics processing unit (GPU) coupled to the processor, the GPU comprising a transform unit, a lighting unit, a renderer unit, and a tessellate unit coupled between the transform unit and the lighting unit;	11. A system, comprising: a processor; and a graphics processing unit (GPU) coupled to the processor, the GPU comprising a transform unit, a lighting unit, a renderer unit, and a tessellate unit coupled between the transform unit and the lighting unit;
wherein the processor transmits objects to be rendered to the GPU as control points, the transform unit transforms the control points, the tessellate unit executes a first set	wherein the processor transmits objects to be rendered to the GPU as control points, the transform unit transforms the control points, the tessellate unit executes a first set

of instructions for tessellating both rational and non-rational object surfaces in real-time, the lighting unit lights vertices of the triangles, and the renderer unit renders the triangles by executing a second set of instructions.	of instructions for tessellating both rational and non-rational object surfaces in real-time the lighting unit lights vertices of the triangles, and the renderer unit renders the triangles by executing a second set of instructions.
--	---

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the “right to exclude” granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory obviousness-type double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent either

Art Unit: 2628

is shown to be commonly owned with this application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement.

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 1-10 and 19 of the currently examined application 11/778,515 are rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-10 and 19 of U.S. Patent No. 7,245,299. Although the conflicting claims are not identical, they are not patentably distinct from each other because it would have been obvious to one of ordinary skill in the art that the claim language provided in claim 1 of the current application 11/778,515: *“A graphics processing unit for rendering objects...in which the objects to be rendered are received as control points of bicubic surfaces...”*, though it is a slight variation from claim 1 of U.S. Patent No. 7,245,299: *“A graphics processing unit for rendering objects...in which the objects to be rendered are transmitted to the graphics processing unit over a bus as control points of bicubic surfaces...”*, is similar in scope and would provide analogous rendering of bicubic surfaces. Therefore in view of the teachings of U.S. Patent No. 7,245,299 (col. 1 lines 23-36: *“Object models are often stored in computer systems in the form of surfaces...the surfaces are generally subdivided or decomposed into triangles in the process of rendering the images...Cubic curves may be generalized to bicubic surfaces...”* and col. 2 lines 42-43: *“The triangle meshes are transmitted over an accelerated graphics port (AGP) bus 6 to the GPU...”*), which discloses that a bus is known in the art to be utilized for transmission of graphics data, such as bicubic surfaces, it would have been obvious to

Art Unit: 2628

one skilled in the art at the time of invention to modify the teachings of claim 1 in the current application with the bus taught by claim 1 of U.S. Patent No. 7,245,299 because this modification would enable received graphics data to be transmitted a bus transmission means commonly known in the art that would provide equivalent rendering of bicubic surfaces. The conflicting claims 19 of both the current application and U.S. Patent No. 7,245,299, are also not patentably distinct from each other because it would have been obvious to one of ordinary skill in the art that the claim language provided in claim 19 of the current application 11/778,515: *“A real-time method for tessellating and rendering surfaces of an object on a computer system, comprising... rendering all the triangles produced after clipping and projection.”*, though it is a slight variation from claim 19 of U.S. Patent No. 7,245,299: *“A real-time method for tessellating and rendering surfaces of an object on a computer system, comprising...rendering all the triangles produced after clipping and projection, and displaying the generated triangles.”*, is similar in scope and would provide analogous real-time tessellation and display of surfaces. Therefore the teachings of claim 19 of U.S. Patent No. 7,245,299, which displays generated triangles, is an obvious variation of the teachings of claim 19 of the current application which discloses rendering generated triangles, in which one skilled in the art at the time of invention would have modified the rendering of triangles generated by claim 19 of the current application, to enable display of the triangles because rendering is a process commonly known in the art to be utilized for display, as disclosed in U.S. Patent No. 7,245,299 col. 1 lines 24-25: *“The process of displaying the object...requires rendering...”*.

Table I listed below is provided to show which claims in the current application, 11/778,515, map to claims of U.S. Patent 7,245,299. Table II is provided below to show how all the claimed limitations from the independent claims 1 and 19 of the current application 11/778,515 map to the independent claims 1 and 19 of U.S. Patent 7,245,299, respectively.

TABLE 1

Current Application: 11/778,515	Claims 1-10 and 19
U.S. Patent: 7,245,299	Claims 1-10 and 19

TABLE II

Current Application: 11/778,515 (Claim 1)	U.S. Patent: 7,245,299 (Claim 1)
1. A graphics processing unit for rendering objects from a software application executing on a processing unit in which the objects to be rendered are received as control points of bicubic surfaces, the graphics processing unit comprising:	1. A graphics processing unit for rendering objects from a software application executing on a processing unit in which the objects to be rendered are transmitted to the graphics processing unit over a bus as control points of bicubic surfaces, the graphics processing unit comprising:
a transform unit; a lighting unit; a renderer unit; and	a transform unit; a lighting unit; a renderer unit; and
a tessellate unit coupled between the transform unit and the lighting unit for tessellating both rational and non-rational object surfaces in real-time.	a tessellate unit coupled between the transform unit and the lighting unit for tessellating both rational and non-rational object surfaces in real-time.

Current Application: 11/778,515 (Claim 19)	U.S. Patent: 7,245,299 (Claim 19)
19. A real-time method for tessellating and rendering surfaces of an object on a computer system, comprising: (a) performing transformation and tessellation by, (i) for each surface, transforming 16 points;	19. A real-time method for tessellating and rendering surfaces of an object on a computer system, comprising: (a) performing transformation and tessellation by, (i) for each surface, transforming 16 points rather than all the vertices inside the surface;
(ii) performing three dimensional surface subdivision by subdividing only two cubic curves comprising the surface; (iii) terminating the subdivision termination by expressing the subdivision in screen coordinates (SC) and by measuring curvature in pixels;	(ii) performing three dimensional surface subdivision by subdividing only two cubic curves comprising the surface; (iii) terminating the subdivision termination by expressing the subdivision in screen coordinates (SC) and by measuring curvature in pixels;
(iv) for each new view, generating a new subdivision, thereby producing automatic level of detail; (v) preventing cracks at boundaries between adjacent surfaces by using a common subdivision for all surfaces sharing a boundary;	(iv) for each new view, generating a new subdivision, thereby producing automatic level of detail; (v) preventing cracks at boundaries between adjacent surfaces by using a common subdivision for all surfaces sharing a boundary;
(vi) for the current subdivision, generating	(vi) for the current subdivision, generating

Art Unit: 2628

the vertices, normals, texture coordinates, and displacements used for bump and displacement mapping; and (vii) generating triangles by connecting neighboring vertices;	the vertices, normals, texture coordinates, and displacements used for bump and displacement mapping; and (vii) generating triangles by connecting neighboring vertices;
(viii) for each vertex, calculating the normal, calculating normal displacement for bump mapping, displacing the normal for bump mapping, displacing the vertex for displacement mapping, wherein bump and displacement mapping are executed pixel by pixel for all the points inside each triangle; and (ix) calculating the normal of each triangle; and	(viii) for each vertex, calculating the normal, calculating normal displacement for bump mapping, displacing the normal for bump mapping, displacing the vertex for displacement mapping, wherein bump and displacement mapping are executed pixel by pixel for all the points inside each triangle; and (ix) calculating the normal of each triangle; and
(b) performing rendering by (i) for each triangle, clipping against a viewing viewport, calculating lighting for additional vertices produced by clipping, and culling backfacing triangles; (ii) projecting all vertices into screen coordinates; and	(b) performing rendering by (i) for each triangle, clipping against a viewing viewport, calculating lighting for additional vertices produced by clipping, and culling backfacing triangles; (ii) projecting all vertices into screen coordinates; and
(iii) rendering all the triangles produced after clipping and projection.	(iii) rendering all the triangles produced after clipping and projection, and displaying the generated triangles.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. The prior art patents and publications on the attached PTO-892 form pertain to subdivision surfaces:

- Fenney et al. U.S. Patent Publication 2004/0113909 A1
- Moreton et al. U.S. Patent 6,906,716 B2
- Oliver et al. U.S. Patent 5,561,754

Title: Bicubic Surface Real Time Tessellation Unit

Publication No. US-2008-0049018-A1

Publication Date: 02/28/2008

NOTICE OF PUBLICATION OF APPLICATION

The above-identified application will be electronically published as a patent application publication pursuant to 37 CFR 1.211, et seq. The patent application publication number and publication date are set forth above.

The publication may be accessed through the USPTO's publicly available Searchable Databases via the Internet at www.uspto.gov. The direct link to access the publication is currently <http://www.uspto.gov/patft/>.

The publication process established by the Office does not provide for mailing a copy of the publication to applicant. A copy of the publication may be obtained from the Office upon payment of the appropriate fee set forth in 37 CFR 1.19(a)(1). Orders for copies of patent application publications are handled by the USPTO's Office of Public Records. The Office of Public Records can be reached by telephone at (703) 308-9726 or (800) 972-6382, by facsimile at (703) 305-8759, by mail addressed to the United States Patent and Trademark Office, Office of Public Records, Alexandria, VA 22313-1450 or via the Internet.

In addition, information on the status of the application, including the mailing date of Office actions and the dates of receipt of correspondence filed in the Office, may also be accessed via the Internet through the Patent Electronic Business Center at www.uspto.gov using the public side of the Patent Application Information and Retrieval (PAIR) system. The direct link to access this status information is currently <http://pair.uspto.gov/>. Prior to publication, such status information is confidential and may only be obtained by applicant using the private side of PAIR.

Further assistance in electronically accessing the publication, or about PAIR, is available by calling the Patent Electronic Business Center at 1-866-217-9197.

NOTICE OF NEW OR REVISED PROJECTED PUBLICATION DATE

The above-identified application has a new or revised projected publication date. The current projected publication date for this application is 02/28/2008. If this is a new projected publication date (there was no previous projected publication date), the application has been cleared by Licensing & Review or a secrecy order has been rescinded and the application is now in the publication queue.

If this is a revised projected publication date (one that is different from a previously communicated projected publication date), the publication date has been revised due to processing delays in the USPTO or the abandonment and subsequent revival of an application. The application is anticipated to be published on a date that is more than six weeks different from the originally-projected publication date.

More detailed publication information is available through the private side of Patent Application Information Retrieval (PAIR) System. The direct link to access PAIR is currently <http://pair.uspto.gov>. Further assistance in electronically accessing the publication, or about PAIR, is available by calling the Patent Electronic Business Center at 1-866-217-9197.

Questions relating to this Notice should be directed to the Office of Patent Publication at 1-888-786-0101.

UPDATED FILING RECEIPT

Date Mailed: 10/04/2007

Receipt is acknowledged of this non-provisional patent application. The application will be taken up for examination in due course. Applicant will be notified as to the results of the examination. Any correspondence concerning the application must include the following identification information: the U.S. APPLICATION NUMBER, FILING DATE, NAME OF APPLICANT, and TITLE OF INVENTION. Fees transmitted by check or draft are subject to collection. Please verify the accuracy of the data presented on this receipt. **If an error is noted on this Filing Receipt, please write to the Office of Initial Patent Examination's Filing Receipt Corrections. Please provide a copy of this Filing Receipt with the changes noted thereon. If you received a "Notice to File Missing Parts" for this application, please submit any corrections to this Filing Receipt with your reply to the Notice. When the USPTO processes the reply to the Notice, the USPTO will generate another Filing Receipt incorporating the requested corrections**

PROTECTING YOUR INVENTION OUTSIDE THE UNITED STATES

Since the rights granted by a U.S. patent extend only throughout the territory of the United States and have no effect in a foreign country, an inventor who wishes patent protection in another country must apply for a patent in a specific country or in regional patent offices. Applicants may wish to consider the filing of an international application under the Patent Cooperation Treaty (PCT). An international (PCT) application generally has the same effect as a regular national patent application in each PCT-member country. The PCT process **simplifies** the filing of patent applications on the same invention in member countries, but **does not result** in a grant of "an international patent" and does not eliminate the need of applicants to file additional documents and fees in countries where patent protection is desired.

Almost every country has its own patent law, and a person desiring a patent in a particular country must make an application for patent in that country in accordance with its particular laws. Since the laws of many countries differ in various respects from the patent law of the United States, applicants are advised to seek guidance from specific foreign countries to ensure that patent rights are not lost prematurely.

Applicants also are advised that in the case of inventions made in the United States, the Director of the USPTO must issue a license before applicants can apply for a patent in a foreign country. The filing of a U.S. patent application serves as a request for a foreign filing license. The application's filing receipt contains further information and guidance as to the status of applicant's license for foreign filing.

Applicants may wish to consult the USPTO booklet, "General Information Concerning Patents" (specifically, the section entitled "Treaties and Foreign Patents") for more information on timeframes and deadlines for filing foreign patent applications. The guide is available either by contacting the USPTO Contact Center at 800-786-9199, or it can be viewed on the USPTO website at <http://www.uspto.gov/web/offices/pac/doc/general/index.html>.

For information on preventing theft of your intellectual property (patents, trademarks and copyrights), you may wish to consult the U.S. Government website, <http://www.stopfakes.gov>. Part of a Department of Commerce initiative, this website includes self-help "toolkits" giving innovators guidance on how to protect intellectual property in specific countries such as China, Korea and Mexico. For questions regarding patent enforcement issues, applicants may call the U.S. Government hotline at 1-866-999-HALT (1-866-999-4158).

LICENSE FOR FOREIGN FILING UNDER

Title 35, United States Code, Section 184

Title 37, Code of Federal Regulations, 5.11 & 5.15

GRANTED

The applicant has been granted a license under 35 U.S.C. 184, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" followed by a date appears on this form. Such licenses are issued in all applications where the conditions for issuance of a license have been met, regardless of whether or not a license may be required as set forth in 37 CFR 5.15. The scope and limitations of this license are set forth in 37 CFR 5.15(a) unless an earlier license has been issued under 37 CFR 5.15(b). The license is subject to revocation upon written notification. The date indicated is the effective date of the license, unless an earlier license of similar scope has been granted under 37 CFR 5.13 or 5.14.

This license is to be retained by the licensee and may be used at any time on or after the effective date thereof unless it is revoked. This license is automatically transferred to any related applications(s) filed under 37 CFR 1.53(d). This license is not retroactive.

The grant of a license does not in any way lessen the responsibility of a licensee for the security of the subject matter as imposed by any Government contract or the provisions of existing laws relating to espionage and the national security or the export of technical data. Licensees should apprise themselves of current regulations especially with respect to certain countries, of other agencies, particularly the Office of Defense Trade Controls, Department of State (with respect to Arms, Munitions and Implements of War (22 CFR 121-128)); the Bureau of Industry and Security, Department of Commerce (15 CFR parts 730-774); the Office of Foreign Assets Control, Department of Treasury (31 CFR Parts 500+) and the Department of Energy.

NOT GRANTED

No license under 35 U.S.C. 184 has been granted at this time, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" DOES NOT appear on this form. Applicant may still petition for a license under 37 CFR 5.12, if a license is desired before the expiration of 6 months from the filing date of the application. If 6 months has lapsed from the filing date of this application and the licensee has not received any indication of a secrecy order under 35 U.S.C. 181, the licensee may foreign file the application pursuant to 37 CFR 5.15(b).

RESPONSE TO NOTICE TO FILE CORRECTED APPLICATION PAPERS

Dear Sir:

In response to the Notice to File Corrected Application Papers issued 8/1/2007, submitted herewith are 14 sheets of Replacement Drawings containing Figures 1-15 to correct drawing informalities. Applicant's attorney attests that no new matter is introduced by the replacement sheets, and that the sheets are submitted solely to correct drawing informalities.

If any unresolved issues remain, please contact Applicant's attorney at the telephone number indicated below.

Respectfully submitted,

/Stephen G. Sullivan/

CERTIFICATION STATEMENT

Please see 37 CFR 1.97 and 1.98 to make the appropriate selection(s):

☐ That each item of information contained in the information disclosure statement was first cited in any communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(1).

OR

☐ That no item of information contained in the information disclosure statement was cited in a communication from a foreign patent office in a counterpart foreign application, and, to the knowledge of the person signing the certification after making reasonable inquiry, no item of information contained in the information disclosure statement was known to any individual designated in 37 CFR 1.56(c) more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(2).

☐ See attached certification statement.

☐ Fee set forth in 37 CFR 1.17 (p) has been submitted herewith.

☒ None

SIGNATURE

A signature of the applicant or representative is required in accordance with CFR 1.33, 10.18. Please see CFR 1.4(d) for the form of the signature.

This collection of information is required by 37 CFR 1.97 and 1.98. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 1 hour to complete, including gathering, preparing and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. **SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

FILING RECEIPT

Date Mailed: 08/01/2007

Receipt is acknowledged of this non-provisional patent application. The application will be taken up for examination in due course. Applicant will be notified as to the results of the examination. Any correspondence concerning the application must include the following identification information: the U.S. APPLICATION NUMBER, FILING DATE, NAME OF APPLICANT, and TITLE OF INVENTION. Fees transmitted by check or draft are subject to collection. Please verify the accuracy of the data presented on this receipt. **If an error is noted on this Filing Receipt, please write to the Office of Initial Patent Examination's Filing Receipt Corrections. Please provide a copy of this Filing Receipt with the changes noted thereon. If you received a "Notice to File Missing Parts" for this application, please submit any corrections to this Filing Receipt with your reply to the Notice. When the USPTO processes the reply to the Notice, the USPTO will generate another Filing Receipt incorporating the requested corrections**

Preliminary Class

PROTECTING YOUR INVENTION OUTSIDE THE UNITED STATES

Since the rights granted by a U.S. patent extend only throughout the territory of the United States and have no effect in a foreign country, an inventor who wishes patent protection in another country must apply for a patent in a specific country or in regional patent offices. Applicants may wish to consider the filing of an international application under the Patent Cooperation Treaty (PCT). An international (PCT) application generally has the same effect as a regular national patent application in each PCT-member country. The PCT process **simplifies** the filing of patent applications on the same invention in member countries, but **does not result** in a grant of "an international patent" and does not eliminate the need of applicants to file additional documents and fees in countries where patent protection is desired.

Almost every country has its own patent law, and a person desiring a patent in a particular country must make an application for patent in that country in accordance with its particular laws. Since the laws of many countries differ in various respects from the patent law of the United States, applicants are advised to seek guidance from specific foreign countries to ensure that patent rights are not lost prematurely.

Applicants also are advised that in the case of inventions made in the United States, the Director of the USPTO must issue a license before applicants can apply for a patent in a foreign country. The filing of a U.S. patent application serves as a request for a foreign filing license. The application's filing receipt contains further information and guidance as to the status of applicant's license for foreign filing.

Applicants may wish to consult the USPTO booklet, "General Information Concerning Patents" (specifically, the section entitled "Treaties and Foreign Patents") for more information on timeframes and deadlines for filing foreign patent applications. The guide is available either by contacting the USPTO Contact Center at 800-786-9199, or it can be viewed on the USPTO website at <http://www.uspto.gov/web/offices/pac/doc/general/index.html>.

For information on preventing theft of your intellectual property (patents, trademarks and copyrights), you may wish to consult the U.S. Government website, <http://www.stopfakes.gov>. Part of a Department of Commerce initiative, this website includes self-help "toolkits" giving innovators guidance on how to protect intellectual property in specific countries such as China, Korea and Mexico. For questions regarding patent enforcement issues, applicants may call the U.S. Government hotline at 1-866-999-HALT (1-866-999-4158).

LICENSE FOR FOREIGN FILING UNDER

Title 35, United States Code, Section 184

Title 37, Code of Federal Regulations, 5.11 & 5.15

GRANTED

The applicant has been granted a license under 35 U.S.C. 184, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" followed by a date appears on this form. Such licenses are issued in all applications where the conditions for issuance of a license have been met, regardless of whether or not a license may be required as set forth in 37 CFR 5.15. The scope and limitations of this license are set forth in 37 CFR 5.15(a) unless an earlier license has been issued under 37 CFR 5.15(b). The license is subject to revocation upon written notification. The date indicated is the effective date of the license, unless an earlier license of similar scope has been granted under 37 CFR 5.13 or 5.14.

This license is to be retained by the licensee and may be used at any time on or after the effective date thereof unless it is revoked. This license is automatically transferred to any related applications(s) filed under 37 CFR 1.53(d). This license is not retroactive.

The grant of a license does not in any way lessen the responsibility of a licensee for the security of the subject matter as imposed by any Government contract or the provisions of existing laws relating to espionage and the national security or the export of technical data. Licensees should apprise themselves of current regulations especially with respect to certain countries, of other agencies, particularly the Office of Defense Trade Controls, Department of State (with respect to Arms, Munitions and Implements of War (22 CFR 121-128)); the Bureau of Industry and Security, Department of Commerce (15 CFR parts 730-774); the Office of Foreign Assets Control, Department of Treasury (31 CFR Parts 500+) and the Department of Energy.

NOT GRANTED

No license under 35 U.S.C. 184 has been granted at this time, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" DOES NOT appear on this form. Applicant may still petition for a license under 37 CFR 5.12, if a license is desired before the expiration of 6 months from the filing date of the application. If 6 months has lapsed from the filing date of this application and the licensee has not received any indication of a secrecy order under 35 U.S.C. 181, the licensee may foreign file the application pursuant to 37 CFR 5.15(b).

CONFIRMATION NO. 1565

FORMALITIES
 LETTER

Date Mailed: 08/01/2007

NOTICE TO FILE CORRECTED APPLICATION PAPERS

Filing Date Granted

An application number and filing date have been accorded to this application. The application is informal since it does not comply with the regulations for the reason(s) indicated below. Applicant is given TWO MONTHS from the date of this Notice within which to correct the informalities indicated below. Extensions of time may be obtained by filing a petition accompanied by the extension fee under the provisions of 37 CFR 1.136(a).

The required item(s) identified below must be timely submitted to avoid abandonment:

- Replacement drawings in compliance with 37 CFR 1.84 and 37 CFR 1.121(d) are required. The drawings submitted are not acceptable because:
 - Numbers, letters, and reference characters on the drawings must measure at least 0.32 cm (1/8 inch) in height. See Figure(s) 2,3,4,6,7-10,13,15.
 - The drawings must be made on paper that has a white background (see 37 CFR 1.84 (e)). For example, drawings on graph paper, lined paper, or paper that has a non-white background are not acceptable. See Figure(s) 15.

Applicant is cautioned that correction of the above items may cause the specification and drawings page count to exceed 100 pages. If the specification and drawings exceed 100 pages, applicant will need to submit the required application size fee.

Replies should be mailed to: Mail Stop Missing Parts
 Commissioner for Patents
 P.O. Box 1450
 Alexandria VA 22313-1450

Registered users of EFS-Web may alternatively submit their reply to this notice via EFS-Web.

DECLARATION AND POWER OF ATTORNEY FOR PATENT APPLICATION

☒ Declaration Submitted with Initial Filing

☐ Declaration Submitted after Initial Filing (surcharge 37 CFR 1.16(e) required)

As a below named inventor, I hereby declare that:

My residence/post office address and citizenship are as stated below next to my name;

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled:

BICUBIC SURFACE REAL-TIME TESSELATION UNIT

the specification of which

☒ is attached hereto.

☐ was filed on _____ as US Application Serial No. _____.

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment(s) specifically referred to above. I acknowledge the duty to disclose all information which is material to patentability as defined in 37 CFR 1.56, including for continuation-in-part applications, material information which became available between the filing date of the prior application and the national or PCT international filing date of the continuation-in-part application.

Foreign Application(s) and/or Claim of Foreign Priority

I hereby claim foreign priority benefits under Title 35, United States Code Section 119 of any foreign application(s) for patent or inventor(s) certificate listed below and have also identified below any foreign application for patent or inventor(s) certificate having a filing date before that of the application on which priority is claimed:

COUNTRY	APPLICATION NUMBER	DATE FILED	PRIORITY CLAIMED UNDER 35 U.S.C. 119
			YES: NO:
			YES: NO:

U.S. Priority Claim

I hereby claim the benefit under Title 35, United States Code, Section 120 of any United States application(s) listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application in the manner provided by the first paragraph of Title 35, United States Code Section 112, I acknowledge the duty to disclose material information as defined in Title 37, Code of Federal Regulations, Section 1.56(a) which occurred between the filing date of the prior application and the national or PCT international filing date of this application:

APPLICATION SERIAL NUMBER	FILING DATE	STATUS(patented/pending/abandoned)
10/436,698	5/12/2003	Pending

Provisional Application

I hereby claim the benefit under Title 35, United States Code Section 119(e) of any United States provisional application(s) listed below:

APPLICATION SERIAL NUMBER	FILING DATE	STATUS(pending)

**DECLARATION AND POWER OF ATTORNEY
FOR PATENT APPLICATION (continued)**

POWER OF ATTORNEY:

As a named inventor, I hereby appoint the following attorney(s) and/or agent(s) listed below to prosecute this application and transact all business in the Patent and Trademark Office connected therewith.

Joseph A. Sawyer, Jr., Reg. No. 30,801
Stephen G. Sullivan, Reg. No. 38,329
Joyce Tom, Reg. No. 48,681

This collection of information is required by 37 CFR 1.76. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 23 minutes to complete, including gathering, preparing, and submitting the completed application data sheet form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. **SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

BICUBIC SURFACE REAL-TIME TESSELATION UNIT

CROSS-REFERENCE TO RELATED APPLICATIONS

The present invention is a continuation of U.S. application serial number
5 10/732,398, entitled "Bicubic Surface Real-Time Tessellation Unit", (1935CIP2) filed on
December 9, 2003, which is a continuation-in-part of U.S. application serial number
10/436,698, entitled "Bicubic Surface Rendering," (1935CIP) filed on May 12, 2003, which
is a continuation-in-part of U.S. Patent No. 6,563,501 entitled "Bicubic Surface Rendering,"
issued May 13, 2003, which claims priority of provisional application 60/222,105, filed on
10 July 28, 2000, which are hereby incorporated by reference.

FIELD OF THE INVENTION

The present invention relates to computer graphics, and more specifically to a
method and apparatus for rendering bicubic surfaces in real-time on a computer system.

15

BACKGROUND OF THE INVENTION

Object models are often stored in computer systems in the form of surfaces. The
process of displaying the object (corresponding to the object model) generally requires
rendering, which usually refers to mapping the object model onto a two dimensional
20 surface. At least when the surfaces are curved, the surfaces are generally subdivided or
decomposed into triangles in the process of rendering the images.

A cubic parametric curve is defined by the positions and tangents at the curve's end
points. A Bezier curve, as shown in Figure 5 for example, is defined by a geometry matrix
of four points (P1-P4) that are defined by the intersections of the tangent vectors at the end
25 points of the curve. Changing the locations of the points changes the shape of the curve.

Cubic curves may be generalized to bicubic surfaces by defining cubic equations of
two parameters, s and t . In other words, bicubic surfaces are defined as parametric
surfaces where the (x,y,z) coordinates in a space called "world coordinates" (WC) of each
point of the surface are functions of s and t , defined by a geometry matrix P comprising 16
30 control points (Figure 5).

While the parameters s and t describe a closed unidimensional interval (typically the interval $[0,1]$) the points (x,y,z) describe the surface:

$x=f(s,t)$, $y=g(s,t)$, $z=h(s,t)$ $s \in [0,1]$, $t \in [0,1]$, where ϵ represents an interval between the two coordinates in the parenthesis.

5 The space determined by s and t , the bidimensional interval $[0,1] \times [0,1]$ is called "parameter coordinates" (PC). Textures described in a space called "texture coordinates" (TC) that can be two or even three dimensional are described by sets of points of two (u,v) or three coordinates ((u,v,q)). The process of attaching a texture to a surface is called "texture - object association " and consists of associating u , v and q with the
10 parameters s and t via some function:

$$u=a(s,t) \quad v=b(s,t) \quad (\text{and } q=c(s,t))$$

Figs. 1A and 1B are diagrams illustrating a process for rendering bicubic surfaces. As shown in Figure 1A, the principle used for rendering such a curved surface 10 is to subdivide it into smaller four sided surfaces or tiles 12 by subdividing the intervals that
15 define the parameters s and t . The subdivision continues until the surfaces resulting from subdivision have a curvature, measured in WC space that is below a predetermined threshold. The subdivision of the intervals defining s and t produces a set of numbers $\{s_i\}$ $i=1,n$ and $\{t_j\}$ $j=1,m$ that determine a subdivision of the PC. This subdivision induces a subdivision of the TC, for each pair (s_i,t_j) we obtain a pair $(u_{i,j}, v_{i,j})$ (or a triplet $(u_{i,j}, v_{i,j}, q_{i,j})$). Here $u_{i,j}=a(s_i,t_j)$, $v_{i,j}=b(s_i,t_j)$, $q_{i,j}=c(s_i,t_j)$. For each pair (s_i,t_j) we also obtain a point
20 (called "vertex") in WC, $V_{i,j} (f(s_i,t_j), g(s_i,t_j), h(s_i,t_j))$. A special type of texture, called displacement map having the pair (p,r) as coordinates can be used to generate special lighting effects. For each pair (s_i,t_j) we also obtain a pair $(p_{i,j}, r_{i,j})$ that index a displacement value $(dx_{i,j}, dy_{i,j}, dz_{i,j})$. for the vertex $V_{i,j}$.

25 This process is executed off-line because the subdivision of the surfaces and the measurement of the resulting curvature are very time consuming. As shown in Figure 1B, when all resulting four sided surfaces (tiles) 12 is below a certain curvature threshold, each such resultant four-sided surface 12 is then divided into two triangles 14 (because they are easily rendered by dedicated hardware) and each triangle surface gets the normal to its
30 surface calculated and each triangle vertex also gets its normal calculated. The normals

are used later on for lighting calculations.

Furthermore, each vertex or triangle plane normal needs to be transformed when the surface is transformed in response to a change of view of the surface, a computationally intensive process that may need dedicated hardware. Also, there is no accounting for the fact that the surfaces are actually rendered in a space called "screen coordinates" (SC) after a process called "projection" which distorts such surfaces to the point where we need to take into consideration the curvature in SC, not in WC.

The state of the art in today's hardware architecture for rendering relies overwhelmingly on triangle databases such as meshes, strips, fans. The current state of the art in the computer graphics industry is described in Figure 2, which shows an architecture of a conventional computer graphics system, including the architecture of a graphics processing unit (GPU). A CPU 1, executes a software application in the form of a game play or a physical or chemical simulation, etc., in which objects to be rendered are represented as triangle meshes in an object database stored in memory. The triangle meshes are transmitted over an accelerated graphics port (AGP) bus 6 to the GPU 5, which is typically part of a display adapter (video card). The AGP bus 6 is a high-speed port that is designed for the display adapter only to provide a direct connection between the card and memory. The GPU 5 includes a transform unit 2, a lighting unit 3 and a renderer unit 4.

The object modeling in the application is executed on parametric surfaces such as nurbs, Bezier, splines, and the surfaces are subdivided or tessellated off-line and stored as triangle vertices in a triangle database by means of commercially available tools, such as the Alias suite. The triangle vertices are then transmitted from the CPU 1 (the triangle server) to the GPU 5 (the rendering engine) at the time for rendering. Previous attempts to execute the tessellation in hardware in real-time have not been successful because of the severe limitations of the implementation so the current state of the art has been off-line tessellation.

Unfortunately, the off-line tessellation produces a fixed triangulation that may exhibit an excessively large number of very small triangles when the object is far away. Triangle rendering in this case is dominated by the processing of vertices (transformation, lighting)

and by the triangle setup (the calculation of the color and texture gradients). Since triangles may reduce to a pixel or less, it is obvious that this is an inefficient treatment.

Conversely, when the object is very close to the viewer, the composing triangles may appear very large and the object loses its smoothness appearance, looking more like a polyhedron.

The increase in the scene complexity has pushed up the number of triangles, which has pushed up the demands for higher bus bandwidth. For example, the bus 6 that connects the CPU 1 with the GPU 5 has increased 8x in frequency, from AGP 1x to AGP 8x in the PC space in the last few years. There are physical constraints in terms of signal propagation that preclude the continuation of the frequency increase in bus design.

With the advent of faster arithmetic it has become possible to change the current architecture such that the CPU 1 will serve parametric patches and the renderer 5 will triangulate such patches in real-time. There are very few past attempts of implementing real-time tessellation in hardware. Sun Corporation tried in the mid-80's to implement such a machine. The implementation was based on an architecture described in a paper by Lien, Sheue-Ling, Shantz, Michael, Pratt, Vaughan "Adaptive Forward Differencing for Rendering Curves and Surfaces", Siggraph '87 Proceedings, pp. 111-118 and in a series of associated patents. The implementation was not a technical and commercial success because it made no good use of triangle based rendering, trying instead to render the surfaces pixel by pixel. The idea was to use adaptive forward differencing in interpolating infinitesimally close parallel cubic curves imbedded into the bicubic. The main drawback was that sometimes the curves were too close together, resulting into pixel overstrikes and other times the curves were too far apart, leaving gaps. Another drawback was that the method is slow.

In the early 90's Nvidia Corporation made an attempt to introduce a biquadric based hardware renderer. The attempt was not a technical and commercial success because biquadrics have an insufficient number of degrees of freedom, all the models use bicubics, none of the models uses biquadrics.

More currently, Henry Moreton from Nvidia has resurrected the real-time tessellation unit described in the US Patent 6,597,356 entitled "Integrated Tesselator in a Graphics

Processing Unit,” issued July 22, 2003. Moreton’s invention doesn’t directly tessellate patches in real-time, but rather uses triangle meshes pre-tesselated off-line in conjunction with a proprietary stitching method that avoids cracking and popping at the seams between the triangle meshes representing surface patches. His tessellator unit outputs triangle
5 databases to be rendered by the existing components of the 3D graphics hardware.

Accordingly, what is needed is a system and method for performing tessellation in real-time. The present invention addresses such a need.

SUMMARY OF THE INVENTION

10 The present invention provides a graphics processing unit for rendering objects from a software application executing on a processing unit in which the objects to be rendered are received as control points of bicubic surfaces. According to the method and system disclosed herein, the graphics processing unit includes a transform unit, a lighting unit, a renderer unit, and a tessellate unit for tessellating both rational and non-rational object
15 surfaces in real-time.

BRIEF DESCRIPTION OF THE DRAWINGS

The present invention will be described with reference to the accompanying drawings, wherein:

20 Figures 1A and 1B are diagrams illustrating a process for rendering bicubic surfaces.

Figure 2 describes the current architecture of a computer graphics system, in specific the current architecture of a graphics processing unit (GPU).

Figure 3 describes the new architecture of a GPU that includes a Tessellator
25 Unit inserted between the Transform Unit and the Light Unit.

Figure 4 describes the architecture of an internet system employing multiple

CPU's at the receiving end performing real-time tessellation.

Figure 5 illustrates a bicubic surface.

Figure 6 describes the recursive subdivision of the convex hull of a Bezier curve.

Figure 7 describes the texture mapping process.

5 Figure 8 illustrates the recursive subdivision of the convex hull of a bicubic surface.

Figure 9 shows how to calculate one criterion for terminating the subdivision.

Figure 10 shows how cracks can appear at the T-joints on the boundary curves between surfaces.

10 Figure 11 shows how to "zipper" the cracks at the T-joints.

Figure 12 shows how using the same subdivision for neighboring surfaces completely avoids the cracks.

Figure 13 shows an example of a strip of surfaces.

Figure 14 shows an example of a fan of surfaces.

15 Figure 15 shows an example of a mesh of surfaces.

DESCRIPTION OF THE INVENTION

20 The present invention is directed to a method and apparatus for minimizing the number of computations required for the subdivision of bicubic surfaces into triangles for real-time tessellation. The following description is presented to enable one of ordinary skill in the art to make and use the invention and is provided in the context of a patent application and its requirements. Various modifications to the preferred embodiment will be readily apparent to those skilled in the art and the generic principles herein may be applied to other embodiments. Thus, the present invention is not intended to be limited to

the embodiment shown but is to be accorded the widest scope consistent with the principles and features described herein.

Because prior art methods for performing surface subdivision are so slow and limited, a method is needed for rendering a curved surface that minimizes the number of required computations, such that the images can potentially be rendered in real-time (as opposed to off-line).

US Patent No. 6,563,501, by the Applicant of the present application, provides an improved method and system for rendering bicubic surfaces of an object on a computer system. Each bicubic surface is defined by sixteen control points and bounded by four boundary curves, and each boundary curve is formed by boundary box of line segments formed between four of the control points. The method and system include transforming only the control points of the surface given a view of the object, rather than points across the entire bicubic surface. Next, a pair of orthogonal boundary curves to process is selected. After the boundary curves have been selected, each of the curves is iteratively subdivided, as shown in Figure 6, wherein two new curves are generated with each subdivision. The subdivision of each of the curves is terminated when the curves satisfy a flatness threshold expressed in screen coordinates, whereby the number of computations required to render the object is minimized.

The method disclosed in the '501 patent minimizes the number of computations required for rendering of an object model by requiring that only two orthogonal curves of the surface be subdivided, as shown in Figure 8. As the number of computations is decreased, the entire rendering process can potentially be performed in real-time. In addition, the computations for subdivision are performed by expressing the criteria of terminating the subdivision in the screen coordinates (SC). As the curvature is estimated based on how flat it appears to be in SC (pixels), rather than how curved it is in WC, the number of computations required may further be minimized. As a result, the possibility of rendering images in real-time is further enhanced. In addition, allowing the curvature to be measured in SC units also allows for accommodating the distance to the viewer, thus giving the process an "automatic level of detail" capability.

The present invention utilizes the above method for minimizing the number of

computations required for the subdivision of bicubic surfaces into triangles in order to provide an improved architecture for the computer graphics pipeline hardware. The improved architecture replaces triangle mesh transformation and rendering with a system that transforms bicubic patches and tessellates the patches in real-time. This process is
5 executed in a real-time tessellation unit that replaces the conventional transformation unit present in the prior art hardware 3D architectures.

According to the present invention, the reduction in computations is attained by reducing the subdivision to the subdivision on only two orthogonal curves. In addition, the criteria for sub-division may be determined in SC. The description is provided with
10 reference to Bezier surfaces for illustration. Due to such features, the present invention may enable objects to be subdivided and rendered in real-time. The partition into triangles may also be adapted to the distance between the surface and the viewer resulting in an optimal number of triangles. As a result, the effect of automatic level of detail may be obtained, whereby the number of resulting triangles is inversely proportional with the
15 distance between the surface and the viewer. The normals to the resulting tiles are also generated in real-time by using the cross product of the vectors that form the edges of the tiles. The texture coordinates associated with the vertices of the resulting triangles are computed in real-time by evaluating the functions: $u=a(s,t)$ $v=b(s,t)$. The whole process is directly influenced by the distance between viewer and object, the SC space plays a major
20 role in the computations.

The steps involved in the combined subdivision and rendering of bicubic surfaces in accordance with the present invention are described below in pseudo code. As will be appreciated by one of ordinary skill in the art, the text between the “/*” and “*/” symbols denote comments explaining the pseudo code. All steps are performed in real-time, and
25 steps 0 through 4 are transformation and tessellation, while steps 5 – 7 are rendering.

Step 0

/* For each surface transform only 16 points instead of transforming all the vertices inside the surface. There is no need to transform the normals to the vertices since they are
30 generated at step 4 */.

For each bicubic surface

Transform the 16 control points and the single normal that determine the surface

5

Step 1

/* Simplify the three dimensional surface subdivision by reducing it to the subdivision of two cubic curves */.

10 For each bicubic surface

Subdivide the boundary curve representing s interval until the projection of the length of the height of the

curve bounding box is below a certain predetermined number of pixels as measured in screen coordinates.

15

Subdivide the boundary curve representing t interval until the projection of the length of the height of the curve bounding box is below a certain predetermined number of pixels as measured in screen coordinates. /*Simplify the subdivision termination criteria by expressing it in screen coordinates (SC) and by measuring the curvature in pixels. For each new view, a new subdivision can be generated, producing automatic level of detail */.

20

Step 2

For all bicubic surfaces sharing a same parameter (either s or t) boundary

Choose as the common subdivision the reunion of the subdivisions in order to prevent cracks showing along the common boundary. – OR-

25

Choose as the common subdivision the finest subdivision (the one with the most points inside the set)

/* Prevent cracks at the boundary between adjacent surfaces by using a common subdivision for all surfaces sharing a boundary */

30

Step 3

/* Generate the vertices, normals, the texture coordinates, and the displacements used for bump and displacement mapping for the present subdivision */

5 For each bicubic surface

 For each pair (si,tj) /*All calculations employ some form of direct evaluation of the variables */

 Calculate ((u_{ij} v_{ij} q_{ij}) (p_{ij} r_{ij}) V_{ij}) thru interpolation

 /*texture , displacement map and vertex coordinates as a function of (si,tj)*/

10 Look up vertex displacement (dx_{ij}, dy_{ij}, dz_{ij}) corresponding to (p_{ij} r_{ij})

 Generate triangles by connecting neighboring vertices.

Step 4

15

 For each vertex V_{ij}

 Calculate the normal N_{ij} to that vertex /* Already transformed in WC */

 Calculate (dN_{ij}) /*normal displacement for bump mapping as a function of (si,tj)*/

 N'_{ij}=N_{ij}+dN_{ij} /*displace the normal for bump mapping*/

20 V'_{ij}=V_{ij}+(dx_{ij}, dy_{ij}, dz_{ij})* N_{ij} /*displace the vertex for displacement mapping*/

 /* bump and displacement mapping are executed in the renderer, pixel by pixel for all the points inside each triangle */

 For each triangle

 Calculate the normal to the triangle /*used for culling */

25

Step 5

 For each triangle

 Clip against the viewing viewport

 Calculate lighting for the additional vertices produced by clipping

30 Cull backfacing triangles

Step 6

Project all the vertices $V_{i,j}$ into screen coordinates (SC)

5

Step 7

Render all the triangles produced after clipping and projection

Referring now to Figure 3, a block diagram of the graphics system of the present invention is shown, where like components from Figure 2 have like reference numerals. The present invention utilizes the above algorithm to provide an improved graphics system 10. The system 10 includes CPU 1 and GPU 7. According to the present invention, the GPU 7 includes a transform unit 2, a lighting unit 3, a renderer unit 4, and a tessellate unit 9 coupled between the transform unit 2 and the lighting unit 3 for tessellating both rational and non-rational object surfaces in real-time.

In operation, the CPU 1 executes a software application and transmits over the AGP bus 6 the object database expressed in a compressed format as control points of the bicubic surfaces. The control points of the bicubic surfaces are transformed by the transform unit 2, and then the surfaces are tessellated into triangles by the tessellate unit 9. The tessellate unit 9 executes the microcode described above in the Step 1 through Step 4, thereby affecting the real-time tessellation. The vertices of the triangles are then lit by the lighting unit 3 and the triangles are rendered by the renderer unit 4 executing steps 5 through 7.

Figure 4 is a diagram illustrating architecture of a network-based graphics system targeting for performing real-time tessellation for online gaming according to a second preferred embodiment of the present invention. This second embodiment targets the interactive multi-player game play over a network, such as the Internet in which multiple client computers 14 comprising a CPU 1 and GPU 5 are in communication with a server 12. The server 12 sends object databases over the Internet in the form of control points for bicubic patches to the CPUs 1 for tessellation of the databases into triangles. The CPUs 1

then transfer the triangles to conventional GPU's 5 comprising transform units 2, lighting units 3 and renderer units 4. In this embodiment, it is the CPUs 1 that execute the microcode steps 0 though 4 described above to effect the real-time tessellation. Note, that the CPUs 1 also execute Step 0, the transformation of the control points.

Referring again to US Patent No. 6,563,501, we use the described subdivision algorithm while applying our termination criterion. The geometric adaptive subdivision induces a corresponding parametric subdivision.

$$\begin{aligned} L1 &= P1 \\ L2 &= (P1 + P2)/2 \\ H &= (P2 + P3)/2 \\ L3 &= (L2 + H)/2 \\ R4 &= P4 \\ R3 &= (P3 + P4)/2 \\ R2 &= (R3 + H)/2 \\ R1 &= L4 = (L3 + R2)/2 \end{aligned}$$

The geometry vectors of the resulting left and right cubic curves may be expressed as follows:

$$GL = \begin{bmatrix} L1 \\ L2 \\ L3 \\ L4 \end{bmatrix} = 1/8 * \begin{bmatrix} 8 & 0 & 0 & 0 \\ 4 & 4 & 0 & 0 \\ 2 & 4 & 2 & 0 \\ 1 & 3 & 3 & 1 \end{bmatrix} * \begin{bmatrix} P1 \\ P2 \\ P3 \\ P4 \end{bmatrix} = 1/8 * DL * G$$

$$\text{where } DL = \begin{bmatrix} 8 & 0 & 0 & 0 \\ 4 & 4 & 0 & 0 \\ 2 & 4 & 2 & 0 \\ 1 & 3 & 3 & 1 \end{bmatrix}$$

$$G = \begin{bmatrix} P1 \\ P2 \\ P3 \\ P4 \end{bmatrix}$$

$$GR = \begin{bmatrix} R1 \\ R2 \\ R3 \end{bmatrix} = 1/8 * \begin{bmatrix} 1 & 3 & 3 & 1 \\ 0 & 2 & 4 & 2 \\ 0 & 0 & 4 & 4 \end{bmatrix} * \begin{bmatrix} P1 \\ P2 \\ P3 \end{bmatrix} = 1/8 * DR * G$$

$$\begin{vmatrix} R4 \\ 0 & 0 & 0 & 8 \end{vmatrix} \quad \begin{vmatrix} P4 \end{vmatrix}$$

$$\text{where DR} = \begin{vmatrix} 0 & 2 & 4 & 2 \\ 1 & 3 & 3 & 1 \\ 0 & 0 & 4 & 4 \\ 0 & 0 & 0 & 8 \end{vmatrix}$$

The edge subdivision results into a subdivision of the parametric intervals s $\{s_0, s_1, \dots, s_i, \dots, s_m\}$ and t $\{t_0, t_1, \dots, t_j, \dots, t_n\}$. Only these two parametric subdivisions are stored for each surface since this is all the information needed to calculate the vertices,

$$V_{ij} = V(x(s_i, t_j), y(s_i, t_j), z(s_i, t_j)) \quad i=1, m, j=1, n$$

$x(s, t) = S^* Mb^* Px^* Mb^t T$ wherein $S = [s_3 \ s_2 \ s \ 1]$ $T = [t_3 \ t_2 \ t \ 1]^t$ The superscript t indicates transposition

$$Mb = \begin{vmatrix} -1 & +3 & -3 & +1 \\ +3 & -6 & +3 & 0 \\ -3 & +3 & 0 & 0 \\ +1 & 0 & 0 & 0 \end{vmatrix}$$

Mb^t is the transposed of matrix Mb

$$Px = \begin{vmatrix} P11 & P12 & P13 & P14 \\ P21 & P22 & P23 & P24 \\ P31 & P32 & P34 & P34 \\ P41 & P42 & P43 & P44 \end{vmatrix} x$$

$$y(s, t) = S^* Mb^* Py^* Mb^t T$$

where

$$Py = \begin{vmatrix} P11 & P12 & P13 & P14 \\ P21 & P22 & P23 & P24 \\ P31 & P32 & P34 & P34 \\ P41 & P42 & P43 & P44 \end{vmatrix} y$$

$$z(s, t) = S^* Mb^* Pz^* Mb^t T$$

For $s = \text{constant}$ the matrix $M = S^* Mb^* Pz^* Mb^t$ is constant and the calculation of the vertices $V(x(s, t), y(s, t), z(s, t))$ reduces to the evaluation of the vector T and of the product $M^* T$. Therefore, the generation of vertices is comparable with vertex transformation. Note that the vertices are generated already transformed in place because the parent bicubic

surface has already been transformed.

In order to determine the vertex normals for each generated vertex $V_{i,j}$ we calculate the cross product between the edge entering the vertex and the edge exiting it and we make sure that we pick the sense that makes an acute angle with the normal to the surface:

$$N_{i,j} = (P_{i-1,j} - P_{i,j}) \times (P_{i,j} - P_{i,j+1}) / \text{length}((P_{i-1,j} - P_{i,j}) \times (P_{i,j} - P_{i,j+1}))$$

If bump mapping or displacement mapping are enabled we need to calculate additional data:

$N'_{i,j} = N_{i,j} + dN_{i,j}$ /*displace the normal for bump mapping, pixel by pixel in the renderer section */

$P'_{i,j} = P_{i,j} + (dx_{i,j}, dy_{i,j}, dz_{i,j}) * N_{i,j}$ /*displace the point P for displacement mapping, pixel by pixel */

We calculate the texture coordinates through bilinear interpolation, as shown in Figure 7. The parameterization of the surface produces a natural interpolation of the texture coordinates, see Figure 7 for details. In our algorithm we calculate the texture coordinates corresponding to the new vertices every time a surface is retesselated while bump and displacement mapping are executed on a pixel by pixel basis in the renderer as in the conventional architectures. There is no attempt to execute bump or displacement mapping on a per triangle vertex basis because this approach would result into a varying level of detail with each tessellation.

The subdivision algorithm described in US Patent no. 6,563,501 applied to non rational surfaces. In a further embodiment of the present invention, the algorithm is extended to another class of surfaces, non uniform rational B-spline surfaces, or NURBS. Nurbs are a very important form of modeling 3-D objects in computer graphics. A non-

include .5 and $n > 1$, for reasons of rapid prototyping and previewing.

According to a further aspect of the present invention, a more general criterion is provided:

5 Maximum {distance (P22 to line (P42, P12), distance (P32 to line (P42, P12)) $\cdot 2d/(P42z+P12z)$ AND

 Maximum {distance (P33 to line (P43, P13), distance (P23 to line (P43, P13)) $\cdot 2d/(P43z+P13z) < n$

AND

10 Maximum {distance (P22 to line (P21, P24), distance (P23 to line (P21, P24)) $\cdot 2d/(P21z+P24z)$ AND

 Maximum {distance (P32 to line (P31, P34), distance (P33 to line (P31, P34)) $\cdot 2d/(P31z+P34z) < n$

AND

15 Maximum {distance (P12 to line (P11, P14), distance (P13 to line (P11, P14)) $\cdot 2d/(P12z+P13z)$ AND

 Maximum {distance (P42 to line (P41, P44), distance (P43 to line (P41, P44)) $\cdot 2d/(P42z+P43z) < n$

AND

20 Maximum {distance (P24 to line (P14, P44), distance (P34 to line (P14, P44)) $\cdot 2d/(P24z+P34z)$ AND

 Maximum {distance (P21 to line (P11, P41), distance (P31 to line (P11, P41)) $\cdot 2d/(P11z+P41z) < n$

25 The above criterion is the most general criterion and it will work for any class of surface, both rational and non-rational. It will also work for deformable surfaces. It will work for surfaces that are more curved along the boundary or more curved internally. Since the curvature of deformable surfaces can switch between being boundary-limited and internally-limited the flatness of both types of curves will need to be measured at the start
30 of the tessellation associated with each instance of the surface. The pair of orthogonal

curves used for tessellation can then be one of: both boundary, both internal, one boundary and one internal.

Yet another embodiment, the subdivision termination criteria may be used for the control of the numerically controlled machines. The criterion described below is calculated in object coordinates. In the formulas described below “tol” represents the tolerance, expressed in units of measurement (typically micrometers) accepted for the processing of the surfaces of the machined parts:

Maximum {distance (P22 to line (P42, P12), distance (P32 to line (P42, P12)) AND
Maximum {distance (P33 to line (P43, P13), distance (P23 to line (P43, P13)) < tol
AND

Maximum {distance (P22 to line (P21, P24), distance (P23 to line (P21, P24)) AND
Maximum {distance (P32 to line (P31, P34), distance (P33 to line (P31, P34)) < tol
AND

Maximum {distance (P12 to line (P11, P14), distance (P13 to line (P11, P14)) AND
Maximum {distance (P42 to line (P41, P44), distance (P43 to line (P41, P44)) < tol
AND

Maximum {distance (P24 to line (P14, P44), distance (P34 to line (P14, P44)) AND
Maximum {distance (P21 to line (P11, P41), distance (P31 to line (P11, P41)) < tol

If there are no special prevention methods, cracks may appear at the boundary between abutting patches. This is mainly due to the fact that the patches are subdivided independently of each other. Abutting patches may and do exhibit different curvatures resulting into different subdivisions. For example, in Figure 10 we see that the right-hand patch has a finer subdivision than the left-hand one. At the boundary we see how a “T-joint” has been formed. When rendering the parallel strips of triangles to the left and to the right of the common boundary a crack may become visible in the area of the T-joint.

One of the approaches disclosed herein exhibits identical straight edges for the two

patches sharing the boundary. The other implementation exhibits even stronger continuity; the subpatches generated through subdivision form continuous strips orthogonal to the shared boundary. This is due to the fact that abutting patches are forced to have the same parametric subdivision. The present invention provides two different crack prevention methods, each employing a slightly different subdivision algorithm.

1. In order to avoid cracks between patches use a “zipper approach” to fix the triangle strips that result at the four borders of the surface. All four boundary curves for the patches situated at the edge of the object are used. See Figure 11 for a rendering of the “zipper” approach. Note that adjacent patches have different parametric subdivisions resulting into different triangle meshes. In this embodiment each patch is subdivided independently. All the subdivisions for all the edges of all the patches are stored. Due to this approach, a common boundary curve between two patches may be subdivided differently inside each of the abutting patches that form the respective boundary. Where two patches abut along a common boundary curve, the strips of triangles on the two sides of the common boundary are compared: if there are triangle vertices belonging to a first strip that are not exactly coincident with the vertices of the second strip, the non-coincident vertices from the first triangle strip are copied into the second strip resulting in a strip with more triangles. Figure 10 shows how the triangle strip on the right side of the boundary curve produces a vertex (a “T-joint”) inside the edge of a triangle belonging to the strip on the left of the boundary. In Figure 11, the “T-joint” has been removed by connecting two edges that emerge from the vertex that originated the “T-joint”.

2. In order to avoid cracks between patches, use a second pass that generates the reunion of the subdivisions for all the patches in a patch strip. All four boundary curves for the patches situated at the edge of the object are used. See Figure 12 for a rendering of this approach. Note that in this case surfaces that share, for example, as parametric boundary, will share the same subdivision in s throughout the surface. The tessellation is deferred until after the subdivisions are generated. Once the subdivisions have been generated all the patches can be tessellated and rendered independent of each other. This makes this approach extremely attractive for parallel processing.

In a preferred embodiment, in order to facilitate the design of drivers for the architecture shown in Figure 3, the present invention provides a Graphics Utility Library (GLU). The GLU includes several different types of primitives including, strips, fans, meshes, and indexed meshes of surface patches.

Below, the first three primitives are described. Referring to Figure 13, in a strip, the first patch contributes 16 vertices, each subsequent patch contributes only 12 because 4 are shared with the previous patch. Of the 16 vertices of the first patch, S1, only 4, the corners P11, P14, P41, P44 have color and texture attributes, the remaining 12 have only geometry attributes. Of the 12 vertices of each subsequent patch, Si, in the strip only one, P44 has color and texture attributes. This fact explains the reduction of the memory footprint and of the bus bandwidth necessary for transmitting the primitive from the CPU to the GPU over the AGP bus. The compression is further increased by the fact that a patch will be expanded into potentially many triangles by the tessellator unit inside the GPU. Each patch has an outward pointing normal.

Referring to Figure 14, each patch has only 3 boundary curves, the fourth boundary having collapsed to the center of the fan. The first patch in the strip enumeration has 11 vertices, each subsequent patch having 8. Vertex P11, listed first in the fan definition, is the center of the fan and has color and texture attributes in addition to geometric ones. The first patch, S1, has two vertices with color and texture attributes, P41 and P44; the remaining 9 have only geometric attributes. Each subsequent patch, Si, has only one vertex with all the attributes.

Referring to Figure 15, in a mesh, the anchor patch, S11 has 16 vertices, all the patches in the horizontal and vertical strips attached to S11 have 12 and all the other patches have 9.

A further embodiment of the present invention provides a method for accelerating rendering. A well known technique used for accelerating rendering is backface culling, which is a method which discards triangles that are facing away from the viewer. It is beneficial to extend this technique to cover backfacing surfaces. This way, we avoid the computational costs of tessellating surfaces that face away from the user. Our proposed method discards such surfaces as a whole, before even starting the tessellation

computation.

Referring to Figure 9, observe that the convex hull is made up of 13 planar side panels ({P41,P44,P43,P42}, {P44,P34,P33,P43}, ...{P33,P23,P22,P32}) and one bottom panel ({P44,P41,P11,P14}) that may not be planar in most cases. The order of listing the
5 vertices in each of the 14 panels coincides with the outwards pointing normal. If any of the 13 side panels is front facing then the surface may be (at least partially) front facing. Therefore, the criterion for culling the patch as backfacing is:

If ANY of the panels of the type {P41, P44, P43, P42} is front facing then the patch should not be culled.

10 An alternative criterion can be given as:

If the bottom panel {P44, P41, P11, P14} is backfacing then the patch should not be culled. This criterion means that since the bottom panel {P44, P41, P11, P14} is backfacing, there may be other panels in the convex hull that may be front facing. This being the case, the patch should not be considered as being backfacing and should not be
15 culled.

A method and system has been disclosed for performing tessellation in real-time in a GPU. Software written according to the present invention is to be stored in some form of computer-readable medium, such as memory or CD-ROM, or transmitted over a network, and executed by a processor. Although the present invention has been described in
20 accordance with the embodiments shown, one of ordinary skill in the art will readily recognize that there could be variations to the embodiments and those variations would be within the spirit and scope of the present invention. Accordingly, many modifications may be made by one of ordinary skill in the art without departing from the spirit and scope of the appended claims.

CLAIMS

What is claimed is:

- 5 1 A graphics processing unit for rendering objects from a software application executing on a processing unit in which the objects to be rendered are received as control points of bicubic surfaces, the graphics processing unit comprising:
 - a transform unit;
 - a lighting unit;
 - 10 a renderer unit; and
 - a tessellate unit coupled between the transform unit and the lighting unit for tessellating both rational and non-rational object surfaces in real-time.
- 2 The graphics processing unit of claim 1 wherein the transform unit transforms the control points, the tessellate unit tessellates the surfaces into triangles by executing a
15 first set of instructions, the lighting unit lights vertices of the triangles, and the renderer unit renders the triangles by executing a second set of instructions.
- 3 The graphics processing unit of claim 2 wherein the first set of instructions simplifies
20 three dimensional surface subdivision of the object surfaces by reducing surface subdivision to a subdivision of two cubic curves by performing instructions for:
 - for each bicubic surface,
 - subdividing a boundary curve representing an s interval until a projection of a
length of a height of a curve bounding box is below a certain predetermined
25 number of pixels as measured in screen coordinates; and
 - subdividing the boundary curve representing a t interval until a projection of a
length of a height of the curve bounding box is below a certain predetermined
number of pixels as measured in screen coordinates.
- 30 4 The graphics processing unit of claim 3 wherein the first set of instructions simplifies

three dimensional surface subdivision by reducing it to the subdivision of two cubic curves by simplifying subdivision termination criteria by expressing the termination criteria in screen (SC) coordinates and by measuring curvature in pixels, wherein for each new view, a new subdivision can be generated, producing automatic level of detail.

5 The graphics processing unit of claim 4 wherein the first set of instructions reduces cracks at the boundaries between surfaces by using a common subdivision for all surfaces sharing a boundary by performing instructions for:

10 for all bicubic surfaces sharing a same s or t parameter boundary,
choosing as a common subdivision a reunion of the subdivisions in order to prevent cracks showing along the common boundary or a finest subdivision, the finest subdivision being the one with the most points inside the set.

15 6 The graphics processing unit of claim 5 wherein the first set of instructions generates vertices, normals, texture coordinates, and displacements used for bump and displacement mapping are generated by performing instructions for:

for each bicubic surface,
for each pair (s_i, t_j) ,
20 calculating $((u_{i,j} \ v_{i,j} \ q_{i,j}) \ (p_{i,j} \ r_{i,j}) \ V_{i,j})$ thru interpolation,
looking up vertex displacement $(dx_{i,j}, dy_{i,j}, dz_{i,j})$ corresponding to $(p_{i,j} \ r_{i,j})$; and
generating triangles by connecting neighboring vertices.

25 7 The graphics processing unit of claim 6 wherein the second set of instructions generates vertices, normals, texture coordinates, and displacements used for bump and displacement mapping by performing instructions for:

for each vertex $V_{i,j}$,
calculating a normal $N_{i,j}$ to that vertex, which was previously transformed in
30 world coordinates

calculating $(dN_{i,j})$ as normal displacement for bump mapping as a function of (s_i, t_j) ;

calculating $N'_{i,j} = N_{i,j} + dN_{i,j}$ to displace the normal for bump mapping; and

calculating $V'_{i,j} = V_{i,j} + (dx_{i,j}, dy_{i,j}, dz_{i,j}) * N_{i,j}$ to displace the vertex for displacement mapping;

for each triangle,

executing bump and displacement mapping pixel-by-pixel for all the points inside the triangle; and

calculating a normal to the triangle for culling.

8 The graphics processing unit of claim 1 wherein the tessellate unit is combined with the transform unit and the lighting unit.

9 The graphics processing unit of claim 1 further including a Graphics Utility Library (GLU) for implementing drivers.

10 The graphics processing unit of claim 9 wherein the GLU includes several different types of primitives including, strips, fans, meshes, and indexed meshes of surface patches.

11 A system, comprising:

a processor; and

a graphics processing unit (GPU) coupled to the processor, the GPU comprising a transform unit, a lighting unit, a renderer unit, and a tessellate unit coupled between the transform unit and the lighting unit;

wherein the processor transmits objects to be rendered to the GPU as control points, the transform unit transforms the control points, the tessellate unit executes a first set of instructions for tessellating both rational and non-rational object surfaces in real-time, the lighting unit lights vertices of the triangles, and the renderer unit renders the triangles by executing a second set of instructions.

12 The graphics system of claim 11 wherein the first set of instructions simplifies three dimensional surface subdivision of the object surfaces by reducing surface subdivision to a subdivision of two cubic curves by performing instructions for:

5 for each bicubic surface,

subdividing a boundary curve representing an s interval until a projection of a length of a height of a curve bounding box is below a certain predetermined number of pixels as measured in screen coordinates; and

subdividing the boundary curve representing a t interval until a projection of a
10 length of a height of the curve bounding box is below a certain predetermined number of pixels as measured in screen coordinates.

13 The graphics system of claim 12 wherein the first set of instructions simplifies three dimensional surface subdivision by reducing it to the subdivision of two cubic curves by
15 simplifying subdivision termination criteria by expressing the termination criteria in screen (SC) coordinates and by measuring curvature in pixels, wherein for each new view, a new subdivision can be generated, producing automatic level of detail.

14 The graphics system of claim 13 wherein the first set of instructions reduces cracks at
20 the boundaries between surfaces by using a common subdivision for all surfaces sharing a boundary by performing instructions for:

for all bicubic surfaces sharing a same s or t parameter boundary,

choosing as a common subdivision a reunion of the subdivisions in order to prevent cracks showing along the common boundary or a finest subdivision, the
25 finest subdivision being the one with the most points inside the set.

15 The graphics system of claim 14 wherein the first set of instructions generates vertices, normals, texture coordinates, and displacements used for bump and displacement mapping are generated by performing instructions for:

30 for each bicubic surface,

for each pair (s_i, t_j) ,
calculating $((u_{i,j} \ v_{i,j} \ q_{i,j}) \ (p_{i,j} \ r_{i,j}) \ V_{i,j})$ thru interpolation,
looking up vertex displacement $(dx_{i,j}, dy_{i,j}, dz_{i,j})$ corresponding to $(p_{i,j}, r_{i,j})$; and
5 generating triangles by connecting neighboring vertices.

16 The graphics system of claim 15 wherein the second set of instructions generates vertices, normals, texture coordinates, and displacements used for bump and displacement mapping by performing instructions for:

10 for each vertex $V_{i,j}$,
calculating a normal $N_{i,j}$ to that vertex, which was previously transformed in world coordinates
calculating $(dN_{i,j})$ as normal displacement for bump mapping as a function of (s_i, t_j) ;
15 calculating $N'_{i,j} = N_{i,j} + dN_{i,j}$ to displace the normal for bump mapping; and
calculating $V'_{i,j} = V_{i,j} + (dx_{i,j}, dy_{i,j}, dz_{i,j}) * N_{i,j}$ to displace the vertex for displacement mapping;
for each triangle,
executing bump and displacement mapping pixel-by-pixel for all the points
20 inside the triangle; and
calculating a normal to the triangle for culling.

17 The graphics system of claim 11 further including a Graphics Utility Library (GLU) for implementing drivers.

25

18 The graphics system of claim 17 wherein the GLU includes several different types of primitives including, strips, fans, meshes, and indexed meshes of surface patches.

19 A real-time method for tessellating and rendering surfaces of an object on a computer system, comprising:

30

- (a) performing transformation and tessellation by,
- (i) for each surface, transforming 16 points;
 - (ii) performing three dimensional surface subdivision by subdividing only two cubic curves comprising the surface;
 - 5 (iii) terminating the subdivision termination by expressing the subdivision in screen coordinates (SC) and by measuring curvature in pixels;
 - (iv) for each new view, generating a new subdivision, thereby producing automatic level of detail;
 - (v) preventing cracks at boundaries between adjacent surfaces by using
10 a common subdivision for all surfaces sharing a boundary;
 - (vi) for the current subdivision, generating the vertices, normals, texture coordinates, and displacements used for bump and displacement mapping; and
 - (vii) generating triangles by connecting neighboring vertices;
 - 15 (viii) for each vertex, calculating the normal, calculating normal displacement for bump mapping, displacing the normal for bump mapping, displacing the vertex for displacement mapping, wherein bump and displacement mapping are executed pixel by pixel for all the points inside each triangle; and
 - 20 (ix) calculating the normal of each triangle; and
- (b) performing rendering by
- (i) for each triangle, clipping against a viewing viewport, calculating lighting for additional vertices produced by clipping, and culling backfacing triangles;
 - 25 (ii) projecting all vertices into screen coordinates; and
 - (iii) rendering all the triangles produced after clipping and projection.

ABSTRACT

The present invention provides a graphics processing unit for rendering objects from a software application executing on a processing unit in which the objects to be rendered are received as control points of bicubic surfaces. According to the method and system
5 disclosed herein, the graphics processing unit includes a transform unit, a lighting unit, a renderer unit, and a tessellate unit for tessellating both rational and non-rational object surfaces in real-time.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.
