

- 17 -

As used herein, hyaluronidase activity refers to the ability to enzymatically catalyze the cleavage of hyaluronic acid. The United States Pharmacopeia (USP) XXII assay for hyaluronidase determines hyaluronidase activity indirectly by measuring the amount of higher molecular weight hyaluronic acid, or hyaluronan, (HA) substrate remaining after the enzyme is allowed to react with the HA for 30 min at 37 °C (USP XXII-NF XVII (1990) 644-645 United States Pharmacopeia Convention, Inc, Rockville, MD). A Reference Standard solution can be used in an assay to ascertain the relative activity, in units, of any hyaluronidase. *In vitro* assays to determine the hyaluronidase activity of hyaluronidases, such as PH20, including soluble PH20 and esPH20, are known in the art and described herein. Exemplary assays include the microturbidity assay described below (see e.g. Example 12) that measures cleavage of hyaluronic acid by hyaluronidase indirectly by detecting the insoluble precipitate formed when the uncleaved hyaluronic acid binds with serum albumin. Reference Standards can be used, for example, to generate a standard curve to determine the activity in Units of the hyaluronidase being tested.

As used herein, neutral active refers to the ability of a PH20 polypeptide to enzymatically catalyze the cleavage of hyaluronic acid at neutral pH. A neutral active C-terminally truncated or N-partially glycosylated PH20 provided herein has or has about 30%, 40%, 50%, 60%, 70%, 80%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99%, 100%, 110%, 120%, 130%, 140%, 150%, 200%, 300%, 400%, 500%, 1000% or more activity compared to the hyaluronidase activity of a corresponding neutral active PH20 that is not C-terminally truncated or N-partially glycosylated.

As used herein, a GPI-anchor attachment signal sequence is a C-terminal sequence of amino acids that directs addition of a preformed GPI-anchor to the polypeptide within the lumen of the ER. GPI-anchor attachment signal sequences are present in the precursor polypeptides of GPI-anchored polypeptides, such as GPI-anchored PH20 polypeptides. The C-terminal GPI-anchor attachment signal sequence typically contains a predominantly hydrophobic region of 8-20 amino acids, preceded by a hydrophilic spacer region of 8-12 amino acids, immediately downstream of the ω -site, or site of GPI-anchor attachment. GPI-anchor attachment signal sequences can

- 18 -

be identified using methods well known in the art. These include, but are not limited to, *in silico* methods and algorithms (see, e.g. Udenfriend et al. (1995) *Methods Enzymol.* 250:571-582, Eisenhaber et al., (1999) *J. Biol. Chem.* 274: 741-758, Kronegg and Buloz, (1999), "Detection/prediction of GPI cleavage site (GPI-anchor) in a protein (DGPI)", e.g., the website 129.194.185.165/dgpi/, Fankhauser et al., (2005) *Bioinformatics* 21:1846-1852, Omaetxebarria et al., (2007) *Proteomics* 7:1951-1960, Pierleoni et al., (2008) *BMC Bioinformatics* 9:392), including those that are readily available on bioinformatic websites, such as the ExPASy Proteomics tools site (e.g., the WorldWideWeb site expasy.ch/tools/).

10 As used herein, a bifucosylated polypeptide refers to a polypeptide that has two fucose residues, one with a α 1,3-linkage and the other with α 1,6-linkage, linked to the same core N-acetylglucosamine moiety, with the N-acetylglucosamine moiety linked to the asparagine residue in the polypeptide chain. Bifucosylated polypeptides generally are produced in insect cells.

15 As used herein, nucleic acids include DNA, RNA and analogs thereof, including peptide nucleic acids (PNA) and mixtures thereof. Nucleic acids can be single or double-stranded. When referring to probes or primers, which are optionally labeled, such as with a detectable label, such as a fluorescent or radiolabel, single-stranded molecules are contemplated. Such molecules are typically of a length such
20 that their target is statistically unique or of low copy number (typically less than 5, generally less than 3) for probing or priming a library. Generally a probe or primer contains at least 14, 16 or 30 contiguous nucleotides of sequence complementary to or identical to a gene of interest. Probes and primers can be 10, 20, 30, 50, 100 or more nucleic acids long.

25 As used herein, a peptide refers to a polypeptide that is greater than or equal to 2 amino acids in length, and less than or equal to 40 amino acids in length.

As used herein, the amino acids which occur in the various sequences of amino acids provided herein are identified according to their known, three-letter or one-letter abbreviations (Table 1). The nucleotides which occur in the various nucleic acid
30 fragments are designated with the standard single-letter designations used routinely in the art.

- 19 -

As used herein, an “amino acid” is an organic compound containing an amino group and a carboxylic acid group. A polypeptide contains two or more amino acids. For purposes herein, amino acids include the twenty naturally-occurring amino acids, non-natural amino acids and amino acid analogs (i.e., amino acids wherein the α -carbon has a side chain).

As used herein, “amino acid residue” refers to an amino acid formed upon chemical digestion (hydrolysis) of a polypeptide at its peptide linkages. The amino acid residues described herein are presumed to be in the “L” isomeric form. Residues in the “D” isomeric form, which are so designated, can be substituted for any L-amino acid residue as long as the desired functional property is retained by the polypeptide. NH₂ refers to the free amino group present at the amino terminus of a polypeptide. COOH refers to the free carboxy group present at the carboxyl terminus of a polypeptide. In keeping with standard polypeptide nomenclature described in J. Biol. Chem., 243: 3557-3559 (1968), and adopted 37 C.F.R., §§ 1.821-1.822, abbreviations for amino acid residues are shown in Table 1:

Table 1 – Table of Correspondence

SYMBOL		
1-Letter	3-Letter	AMINO ACID
Y	Tyr	Tyrosine
G	Gly	Glycine
F	Phe	Phenylalanine
M	Met	Methionine
A	Ala	Alanine
S	Ser	Serine
I	Ile	Isoleucine
L	Leu	Leucine
T	Thr	Threonine
V	Val	Valine
P	Pro	Proline
K	Lys	Lysine
H	His	Histidine
Q	Gln	Glutamine
E	Glu	Glutamic acid
Z	Glx	Glu and/or Gln
W	Trp	Tryptophan
R	Arg	Arginine
D	Asp	Aspartic acid
N	Asn	Asparagine

- 20 -

SYMBOL		
1-Letter	3-Letter	AMINO ACID
B	Asx	Asn and/or Asp
C	Cys	Cysteine
X	Xaa	Unknown or other

All amino acid residue sequences represented herein by formulae have a left to right orientation in the conventional direction of amino-terminus to carboxyl-terminus. In addition, the phrase "amino acid residue" is defined to include the amino acids listed in the Table of Correspondence (Table 1) and modified and unusual amino acids, such as those referred to in 37 C.F.R. §§ 1.821-1.822, and incorporated herein by reference. Furthermore, it should be noted that a dash at the beginning or end of an amino acid residue sequence indicates a peptide bond to a further sequence of one or more amino acid residues, to an amino-terminal group such as NH₂ or to a carboxyl-terminal group such as COOH.

As used herein, the "naturally occurring α -amino acids" are the residues of those 20 α -amino acids found in nature which are incorporated into protein by the specific recognition of the charged tRNA molecule with its cognate mRNA codon in humans. Non-naturally occurring amino acids thus include, for example, amino acids or analogs of amino acids other than the 20 naturally-occurring amino acids and include, but are not limited to, the D-isostereomers of amino acids. Exemplary non-natural amino acids are described herein and are known to those of skill in the art.

As used herein, a DNA construct is a single- or double-stranded, linear or circular DNA molecule that contains segments of DNA combined and juxtaposed in a manner not found in nature. DNA constructs exist as a result of human manipulation, and include clones and other copies of manipulated molecules.

As used herein, a DNA segment is a portion of a larger DNA molecule having specified attributes. For example, a DNA segment encoding a specified polypeptide is a portion of a longer DNA molecule, such as a plasmid or plasmid fragment, which, when read from the 5' to 3' direction, encodes the sequence of amino acids of the specified polypeptide.

As used herein, the term polynucleotide means a single- or double-stranded polymer of deoxyribonucleotides or ribonucleotide bases read from the 5' to the 3'

- 21 -

end. Polynucleotides include RNA and DNA, and can be isolated from natural sources, synthesized in vitro, or prepared from a combination of natural and synthetic molecules. The length of a polynucleotide molecule is given herein in terms of nucleotides (abbreviated "nt") or base pairs (abbreviated "bp"). The term nucleotides
5 is used for single- and double-stranded molecules where the context permits. When the term is applied to double-stranded molecules it is used to denote overall length and will be understood to be equivalent to the term base pairs. It will be recognized by those skilled in the art that the two strands of a double-stranded polynucleotide can differ slightly in length and that the ends thereof can be staggered; thus all nucleotides
10 within a double-stranded polynucleotide molecule may not be paired. Such unpaired ends will, in general, not exceed 20 nucleotides in length.

As used herein, "similarity" between two proteins or nucleic acids refers to the relatedness between the sequence of amino acids of the proteins or the nucleotide sequences of the nucleic acids. Similarity can be based on the degree of identity
15 and/or homology of sequences of residues and the residues contained therein. Methods for assessing the degree of similarity between proteins or nucleic acids are known to those of skill in the art. For example, in one method of assessing sequence similarity, two amino acid or nucleotide sequences are aligned in a manner that yields a maximal level of identity between the sequences. "Identity" refers to the extent to
20 which the amino acid or nucleotide sequences are invariant. Alignment of amino acid sequences, and to some extent nucleotide sequences, also can take into account conservative differences and/or frequent substitutions in amino acids (or nucleotides). Conservative differences are those that preserve the physico-chemical properties of the residues involved. Alignments can be global (alignment of the compared
25 sequences over the entire length of the sequences and including all residues) or local (the alignment of a portion of the sequences that includes only the most similar region or regions).

"Identity" per se has an art-recognized meaning and can be calculated using published techniques. (See, e.g. Computational Molecular Biology, Lesk, A.M., ed.,
30 Oxford University Press, New York, 1988; Biocomputing: Informatics and Genome Projects, Smith, D.W., ed., Academic Press, New York, 1993; Computer Analysis of

- 22 -

Sequence Data, Part I, Griffin, A.M., and Griffin, H.G., eds., Humana Press, New Jersey, 1994; Sequence Analysis in Molecular Biology, von Heinje, G., Academic Press, 1987; and Sequence Analysis Primer, Gribskov, M. and Devereux, J., eds., M Stockton Press, New York, 1991). While there exists a number of methods to
5 measure identity between two polynucleotide or polypeptides, the term “identity” is well known to skilled artisans (Carillo, H. & Lipton, D., SIAM J Applied Math 48:1073 (1988)).

As used herein, homologous (with respect to nucleic acid and/or amino acid sequences) means about greater than or equal to 25% sequence homology, typically
10 greater than or equal to 25%, 40%, 50%, 60%, 70%, 80%, 85%, 90% or 95% sequence homology; the precise percentage can be specified if necessary. For purposes herein the terms “homology” and “identity” are often used interchangeably, unless otherwise indicated. In general, for determination of the percentage homology or identity, sequences are aligned so that the highest order match is obtained (see, e.g.:
15 Computational Molecular Biology, Lesk, A.M., ed., Oxford University Press, New York, 1988; Biocomputing: Informatics and Genome Projects, Smith, D.W., ed., Academic Press, New York, 1993; Computer Analysis of Sequence Data, Part I, Griffin, A.M., and Griffin, H.G., eds., Humana Press, New Jersey, 1994; Sequence Analysis in Molecular Biology, von Heinje, G., Academic Press, 1987; and Sequence
20 Analysis Primer, Gribskov, M. and Devereux, J., eds., M Stockton Press, New York, 1991; Carillo et al. (1988) SIAM J Applied Math 48:1073). By sequence homology, the number of conserved amino acids is determined by standard alignment algorithms programs, and can be used with default gap penalties established by each supplier. Substantially homologous nucleic acid molecules would hybridize typically at
25 moderate stringency or at high stringency all along the length of the nucleic acid of interest. Also contemplated are nucleic acid molecules that contain degenerate codons in place of codons in the hybridizing nucleic acid molecule.

Whether any two molecules have nucleotide sequences or amino acid sequences that are at least 60%, 70%, 80%, 85%, 90%, 95%, 96%, 97%, 98% or 99%
30 “identical” or “homologous” can be determined using known computer algorithms such as the “FASTA” program, using for example, the default parameters as in

- 23 -

Pearson et al. (1988) *Proc. Natl. Acad. Sci. USA* 85:2444 (other programs include the GCG program package (Devereux, J., et al., *Nucleic Acids Research* 12(I):387 (1984)), BLASTP, BLASTN, FASTA (Atschul, S.F., et al., *J Mol Biol* 215:403 (1990)); Guide to Huge Computers, Martin J. Bishop, ed., Academic Press, San Diego, 1994, and Carillo et al. (1988) *SIAM J Applied Math* 48:1073). For example, the BLAST function of the National Center for Biotechnology Information database can be used to determine identity. Other commercially or publicly available programs include, DNASTar "MegAlign" program (Madison, WI) and the University of Wisconsin Genetics Computer Group (UWG) "Gap" program (Madison WI). Percent homology or identity of proteins and/or nucleic acid molecules can be determined, for example, by comparing sequence information using a GAP computer program (e.g., Needleman et al. (1970) *J. Mol. Biol.* 48:443, as revised by Smith and Waterman ((1981) *Adv. Appl. Math.* 2:482). Briefly, the GAP program defines similarity as the number of aligned symbols (i.e., nucleotides or amino acids), which are similar, divided by the total number of symbols in the shorter of the two sequences. Default parameters for the GAP program can include: (1) a unary comparison matrix (containing a value of 1 for identities and 0 for non-identities) and the weighted comparison matrix of Gribskov et al. (1986) *Nucl. Acids Res.* 14:6745, as described by Schwartz and Dayhoff, eds., *ATLAS OF PROTEIN SEQUENCE AND STRUCTURE*, National Biomedical Research Foundation, pp. 353-358 (1979); (2) a penalty of 3.0 for each gap and an additional 0.10 penalty for each symbol in each gap; and (3) no penalty for end gaps.

Therefore, as used herein, the term "identity" or "homology" represents a comparison between a test and a reference polypeptide or polynucleotide. As used herein, the term at least "90% identical to" refers to percent identities from 90 to 99.99 relative to the reference nucleic acid or amino acid sequence of the polypeptide. Identity at a level of 90% or more is indicative of the fact that, assuming for exemplification purposes a test and reference polypeptide length of 100 amino acids are compared. No more than 10% (i.e., 10 out of 100) of the amino acids in the test polypeptide differs from that of the reference polypeptide. Similar comparisons can be made between test and reference polynucleotides. Such differences can be

- 24 -

represented as point mutations randomly distributed over the entire length of a polypeptide or they can be clustered in one or more locations of varying length up to the maximum allowable, e.g. 10/100 amino acid difference (approximately 90% identity). Differences are defined as nucleic acid or amino acid substitutions,
5 insertions or deletions. At the level of homologies or identities above about 85-90%, the result should be independent of the program and gap parameters set; such high levels of identity can be assessed readily, often by manual alignment without relying on software.

As used herein, an aligned sequence refers to the use of homology (similarity
10 and/or identity) to align corresponding positions in a sequence of nucleotides or amino acids. Typically, two or more sequences that are related by 50% or more identity are aligned. An aligned set of sequences refers to 2 or more sequences that are aligned at corresponding positions and can include aligning sequences derived from RNAs, such as ESTs and other cDNAs, aligned with genomic DNA sequence.

As used herein, "primer" refers to a nucleic acid molecule that can act as a point of initiation of template-directed DNA synthesis under appropriate conditions (e.g., in the presence of four different nucleoside triphosphates and a polymerization agent, such as DNA polymerase, RNA polymerase or reverse transcriptase) in an appropriate buffer and at a suitable temperature. It will be appreciated that a certain
20 nucleic acid molecules can serve as a "probe" and as a "primer." A primer, however, has a 3' hydroxyl group for extension. A primer can be used in a variety of methods, including, for example, polymerase chain reaction (PCR), reverse-transcriptase (RT)-PCR, RNA PCR, LCR, multiplex PCR, panhandle PCR, capture PCR, expression PCR, 3' and 5' RACE, in situ PCR, ligation-mediated PCR and other amplification
25 protocols.

As used herein, "primer pair" refers to a set of primers that includes a 5' (upstream) primer that hybridizes with the 5' end of a sequence to be amplified (e.g. by PCR) and a 3' (downstream) primer that hybridizes with the complement of the 3' end of the sequence to be amplified.

As used herein, "specifically hybridizes" refers to annealing, by
30 complementary base-pairing, of a nucleic acid molecule (e.g. an oligonucleotide) to a

- 25 -

target nucleic acid molecule. Those of skill in the art are familiar with in vitro and in vivo parameters that affect specific hybridization, such as length and composition of the particular molecule. Parameters particularly relevant to in vitro hybridization further include annealing and washing temperature, buffer composition and salt concentration. Exemplary washing conditions for removing non-specifically bound nucleic acid molecules at high stringency are 0.1 x SSPE, 0.1% SDS, 65°C, and at medium stringency are 0.2 x SSPE, 0.1% SDS, 50°C. Equivalent stringency conditions are known in the art. The skilled person can readily adjust these parameters to achieve specific hybridization of a nucleic acid molecule to a target nucleic acid molecule appropriate for a particular application. Complementary, when referring to two nucleotide sequences, means that the two sequences of nucleotides are capable of hybridizing, typically with less than 25%, 15% or 5% mismatches between opposed nucleotides. If necessary, the percentage of complementarity will be specified. Typically the two molecules are selected such that they will hybridize under conditions of high stringency.

As used herein, substantially identical to a product means sufficiently similar so that the property of interest is sufficiently unchanged so that the substantially identical product can be used in place of the product.

As used herein, it also is understood that the terms “substantially identical” or “similar” varies with the context as understood by those skilled in the relevant art.

As used herein, an allelic variant or allelic variation references any of two or more alternative forms of a gene occupying the same chromosomal locus. Allelic variation arises naturally through mutation, and can result in phenotypic polymorphism within populations. Gene mutations can be silent (no change in the encoded polypeptide) or can encode polypeptides having altered amino acid sequence. The term “allelic variant” also is used herein to denote a protein encoded by an allelic variant of a gene. Typically the reference form of the gene encodes a wildtype form and/or predominant form of a polypeptide from a population or single reference member of a species. Typically, allelic variants, which include variants between and among species typically have at least 80%, 90% or greater amino acid identity with a wildtype and/or predominant form from the same species; the degree of identity

- 26 -

depends upon the gene and whether comparison is interspecies or intraspecies. Generally, intraspecies allelic variants have at least about 80%, 85%, 90% or 95% identity or greater with a wildtype and/or predominant form, including 96%, 97%, 98%, 99% or greater identity with a wildtype and/or predominant form of a polypeptide. Reference to an allelic variant herein generally refers to variations in proteins among members of the same species.

As used herein, "allele," which is used interchangeably herein with "allelic variant" refers to alternative forms of a gene or portions thereof. Alleles occupy the same locus or position on homologous chromosomes. When a subject has two identical alleles of a gene, the subject is said to be homozygous for that gene or allele. When a subject has two different alleles of a gene, the subject is said to be heterozygous for the gene. Alleles of a specific gene can differ from each other in a single nucleotide or several nucleotides, and can include modifications such as substitutions, deletions and insertions of nucleotides. An allele of a gene also can be a form of a gene containing a mutation.

As used herein, species variants refer to variants in polypeptides among different species, including different mammalian species, such as mouse and human. Exemplary of species variants provided herein are primate PH20, such as, but not limited to, human, chimpanzee, macaque and cynomolgus monkey. Generally, species variants have 70%, 75%, 80%, 85%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98% or sequence identity. Corresponding residues between and among species variants can be determined by comparing and aligning sequences to maximize the number of matching nucleotides or residues, for example, such that identity between the sequences is equal to or greater than 95%, equal to or greater than 96%, equal to or greater than 97%, equal to or greater than 98% or equal to greater than 99%. The position of interest is then given the number assigned in the reference nucleic acid molecule. Alignment can be effected manually or by eye, particularly, where sequence identity is greater than 80%. For example, the alignment in Figure 1 shows that amino acid residue 491 of human PH20 corresponds to amino acid residue 491 of chimpanzee PH20 and amino acid residue 497 of human PH20 corresponds to amino acid residue 498 of chimpanzee PH20.

- 27 -

As used herein, a splice variant refers to a variant produced by differential processing of a primary transcript of genomic DNA that results in more than one type of mRNA.

As used herein, modification is in reference to modification of a sequence of
5 amino acids of a polypeptide or a sequence of nucleotides in a nucleic acid molecule and includes deletions, insertions, and replacements of amino acids and nucleotides, respectively. Methods of modifying a polypeptide are routine to those of skill in the art, such as by using recombinant DNA methodologies.

As used herein, the term promoter means a portion of a gene containing DNA
10 sequences that provide for the binding of RNA polymerase and initiation of transcription. Promoter sequences are commonly, but not always, found in the 5' non-coding region of genes.

As used herein, isolated or purified polypeptide or protein or biologically-active portion thereof is substantially free of cellular material or other contaminating
15 proteins from the cell or tissue from which the protein is derived, or substantially free from chemical precursors or other chemicals when chemically synthesized. Preparations can be determined to be substantially free if they appear free of readily detectable impurities as determined by standard methods of analysis, such as thin layer chromatography (TLC), gel electrophoresis and high performance liquid
20 chromatography (HPLC), used by those of skill in the art to assess such purity, or sufficiently pure such that further purification would not detectably alter the physical and chemical properties, such as enzymatic and biological activities, of the substance. Methods for purification of the compounds to produce substantially chemically pure compounds are known to those of skill in the art. A substantially chemically pure
25 compound, however, can be a mixture of stereoisomers. In such instances, further purification might increase the specific activity of the compound.

Hence, reference to a substantially purified polypeptide, such as a substantially purified extended soluble PH20 refers to preparations of PH20 proteins that are substantially free of cellular material includes preparations of proteins in which the
30 protein is separated from cellular components of the cells from which it is isolated or recombinantly-produced. In one embodiment, the term substantially free of cellular

- 28 -

material includes preparations of enzyme proteins having less than about 30% (by dry weight) of non-enzyme proteins (also referred to herein as a contaminating protein), generally less than about 20% of non-enzyme proteins or 10% of non-enzyme proteins or less than about 5% of non-enzyme proteins. When the enzyme protein is
5 recombinantly produced, it also is substantially free of culture medium, i.e., culture medium represents less than about or at 20%, 10% or 5% of the volume of the enzyme protein preparation.

As used herein, the term substantially free of chemical precursors or other chemicals includes preparations of enzyme proteins in which the protein is separated
10 from chemical precursors or other chemicals that are involved in the synthesis of the protein. The term includes preparations of enzyme proteins having less than about 30% (by dry weight), 20%, 10%, 5% or less of chemical precursors or non-enzyme chemicals or components.

As used herein, synthetic, with reference to, for example, a synthetic nucleic
15 acid molecule or a synthetic gene or a synthetic peptide refers to a nucleic acid molecule or polypeptide molecule that is produced by recombinant methods and/or by chemical synthesis methods.

As used herein, production by recombinant means or using recombinant DNA methods means the use of the well known methods of molecular biology for
20 expressing proteins encoded by cloned DNA.

As used herein, vector (or plasmid) refers to discrete elements that are used to introduce a heterologous nucleic acid into cells for either expression or replication thereof. The vectors typically remain episomal, but can be designed to effect integration of a gene or portion thereof into a chromosome of the genome. Also
25 contemplated are vectors that are artificial chromosomes, such as yeast artificial chromosomes and mammalian artificial chromosomes. Selection and use of such vehicles are well known to those of skill in the art.

As used herein, an expression vector includes vectors capable of expressing DNA that is operatively linked with regulatory sequences, such as promoter regions,
30 that are capable of effecting expression of such DNA fragments. Such additional segments can include promoter and terminator sequences, and optionally can include

- 29 -

one or more origins of replication, one or more selectable markers, an enhancer, a polyadenylation signal, and the like. Expression vectors are generally derived from plasmid or viral DNA, or can contain elements of both. Thus, an expression vector refers to a recombinant DNA or RNA construct, such as a plasmid, a phage,
5 recombinant virus or other vector that, upon introduction into an appropriate host cell, results in expression of the cloned DNA. Appropriate expression vectors are well known to those of skill in the art and include those that are replicable in eukaryotic cells and/or prokaryotic cells and those that remain episomal or those which integrate into the host cell genome.

10 As used herein, vector also includes “virus vectors” or “viral vectors.” Viral vectors are engineered viruses that are operatively linked to exogenous genes to transfer (as vehicles or shuttles) the exogenous genes into cells.

As used herein, “operably” or “operatively linked” when referring to DNA segments means that the segments are arranged so that they function in concert for
15 their intended purposes, e.g., transcription initiates downstream of the promoter and upstream of any transcribed sequences. The promoter is usually the domain to which the transcriptional machinery binds to initiate transcription and proceeds through the coding segment to the terminator.

As used herein the term “assessing” is intended to include quantitative and
20 qualitative determination in the sense of obtaining an absolute value for the activity of a protease, or a domain thereof, present in the sample, and also of obtaining an index, ratio, percentage, visual or other value indicative of the level of the activity. Assessment can be direct or indirect and the chemical species actually detected need not of course be the proteolysis product itself but can for example be a derivative
25 thereof or some further substance. For example, detection of a cleavage product of a complement protein, such as by SDS-PAGE and protein staining with Coomassie blue.

As used herein, biological activity refers to the *in vivo* activities of a compound or physiological responses that result upon *in vivo* administration of a compound, composition or other mixture. Biological activity, thus, encompasses
30 therapeutic effects and pharmaceutical activity of such compounds, compositions and mixtures. Biological activities can be observed in *in vitro* systems designed to test or

- 30 -

use such activities. Thus, for purposes herein a biological activity of a protease is its catalytic activity in which a polypeptide is hydrolyzed.

As used herein equivalent, when referring to two sequences of nucleic acids, means that the two sequences in question encode the same sequence of amino acids or equivalent proteins. When equivalent is used in referring to two proteins or peptides, it means that the two proteins or peptides have substantially the same amino acid sequence with only amino acid substitutions that do not substantially alter the activity or function of the protein or peptide. When equivalent refers to a property, the property does not need to be present to the same extent (e.g., two peptides can exhibit different rates of the same type of enzymatic activity), but the activities are usually substantially the same.

As used herein, “modulate” and “modulation” or “alter” refer to a change of an activity of a molecule, such as a protein. Exemplary activities include, but are not limited to, biological activities, such as signal transduction. Modulation can include an increase in the activity (i.e., up-regulation or agonist activity), a decrease in activity (i.e., down-regulation or inhibition) or any other alteration in an activity (such as a change in periodicity, frequency, duration, kinetics or other parameter). Modulation can be context dependent and typically modulation is compared to a designated state, for example, the wildtype protein, the protein in a constitutive state, or the protein as expressed in a designated cell type or condition.

As used herein, a composition refers to any mixture. It can be a solution, suspension, liquid, powder, paste, aqueous, non-aqueous or any combination thereof.

As used herein, a combination refers to any association between or among two or more items. The combination can be two or more separate items, such as two compositions or two collections, can be a mixture thereof, such as a single mixture of the two or more items, or any variation thereof. The elements of a combination are generally functionally associated or related.

As used herein, “disease or disorder” refers to a pathological condition in an organism resulting from cause or condition including, but not limited to, infections, acquired conditions, genetic conditions, and characterized by identifiable symptoms. Diseases and disorders of interest herein are those involving components of the ECM.

- 31 -

As used herein, "treating" a subject with a disease or condition means that the subject's symptoms are partially or totally alleviated, or remain static following treatment. Hence treatment encompasses prophylaxis, therapy and/or cure. Prophylaxis refers to prevention of a potential disease and/or a prevention of
5 worsening of symptoms or progression of a disease. Treatment also encompasses any pharmaceutical use of a modified interferon and compositions provided herein.

As used herein, a pharmaceutically effective agent, includes any therapeutic agent or bioactive agent, including, but not limited to, for example, anesthetics, vasoconstrictors, dispersing agents, conventional therapeutic drugs, including small
10 molecule drugs, including, but not limited to, bisphosphonates, and therapeutic proteins, including, but not limited to, insulin, IgG molecules, and antibodies.

As used herein, a therapeutic agent, includes any pharmaceutically effective agent or bioactive agent, including, but not limited to, for example, anesthetics, vasoconstrictors, dispersing agents, conventional therapeutic drugs, including small
15 molecule drugs, including, but not limited to, bisphosphonates, and therapeutic proteins, including, but not limited to, insulin, IgG molecules, and antibodies.

As used herein, treatment means any manner in which the symptoms of a condition, disorder or disease or other indication, are ameliorated or otherwise beneficially altered.

20 As used herein, therapeutic effect means an effect resulting from treatment of a subject that alters, typically improves or ameliorates the symptoms of a disease or condition or that cures a disease or condition. A therapeutically effective amount refers to the amount of a composition, molecule or compound which results in a therapeutic effect following administration to a subject.

25 As used herein, the term "subject" refers to an animal, including a mammal, such as a human being.

As used herein, a patient refers to a human subject exhibiting symptoms of a disease or disorder.

As used herein, amelioration of the symptoms of a particular disease or
30 disorder by a treatment, such as by administration of a pharmaceutical composition or other therapeutic, refers to any lessening, whether permanent or temporary, lasting or

- 32 -

transient, of the symptoms that can be attributed to or associated with administration of the composition or therapeutic.

As used herein, prevention or prophylaxis refers to methods in which the risk of developing disease or condition is reduced.

5 As used herein, a “therapeutically effective amount” or a “therapeutically effective dose” refers to the quantity of an agent, compound, material, or composition containing a compound that is at least sufficient to produce a therapeutic effect. Hence, it is the quantity necessary for preventing, curing, ameliorating, arresting or partially arresting a symptom of a disease or disorder.

10 As used herein, unit dose form refers to physically discrete units suitable for human and animal subjects and packaged individually as is known in the art.

As used herein, a single dosage formulation refers to a formulation for direct administration.

As used herein, an “article of manufacture” is a product that is made and sold.
15 As used throughout this application, the term is intended to encompass a therapeutic agent with a soluble PH20, such as esPH20, or an esPH20 alone, contained in the same or separate articles of packaging.

As used herein, fluid refers to any composition that can flow. Fluids thus encompass compositions that are in the form of semi-solids, pastes, solutions, aqueous
20 mixtures, gels, lotions, creams and other such compositions.

As used herein, a “kit” refers to a combination of compositions provided herein and another item for a purpose including, but not limited to, reconstitution, activation, and instruments/devices for delivery, administration, diagnosis, and assessment of a biological activity or property. Kits optionally include instructions
25 for use.

As used herein, a cellular extract or lysate refers to a preparation or fraction which is made from a lysed or disrupted cell.

As used herein, animal includes any animal, such as, but are not limited to primates including humans, gorillas and monkeys; rodents, such as mice and rats;
30 fowl, such as chickens; ruminants, such as goats, cows, deer, sheep; pigs and other animals. Non-human animals exclude humans as the contemplated animal. The

- 33 -

enzymes provided herein are from any source, animal, plant, prokaryotic and fungal. Most enzymes are of animal origin, including mammalian origin.

As used herein, a control refers to a sample that is substantially identical to the test sample, except that it is not treated with a test parameter, or, if it is a plasma sample, it can be from a normal volunteer not affected with the condition of interest. A control also can be an internal control.

As used herein, the singular forms “a,” “an” and “the” include plural referents unless the context clearly dictates otherwise. Thus, for example, reference to a compound comprising “an extracellular domain” includes compounds with one or a plurality of extracellular domains.

As used herein, ranges and amounts can be expressed as “about” a particular value or range. About also includes the exact amount. Hence “about 5 bases” means “about 5 bases” and also “5 bases.”

As used herein, “optional” or “optionally” means that the subsequently described event or circumstance does or does not occur, and that the description includes instances where said event or circumstance occurs and instances where it does not. For example, an optionally substituted group means that the group is unsubstituted or is substituted.

As used herein, the abbreviations for any protective groups, amino acids and other compounds, are, unless indicated otherwise, in accord with their common usage, recognized abbreviations, or the IUPAC-IUB Commission on Biochemical Nomenclature (see, (1972) *Biochem.* 11:1726).

B. Overview

Hyaluronidases are enzymes that catalyze the hydrolysis of hyaluronic acid, thereby lowering the viscosity of hyaluronic acid and increasing tissue permeability. PH20 is a neutral-active and acid-active hyaluronidase that exhibits optimal activity when glycosylated. Human PH20 is a GPI-anchored protein that is anchored to the extracellular leaflet of the plasma membrane via a glycosylphosphatidylinositol (GPI) anchor attached to the C-terminus of the protein. The addition of the GPI anchor to all GPI-anchored proteins occurs following cleavage at a specific amino acid position, called the ω -site (typically located approximately 20-30 amino acids from the C-

- 34 -

terminus), and removal of the C-terminal portion in the ER. This C-terminal portion is the GPI-anchor attachment signal sequence. The GPI-anchor attachment signal sequence of human PH20 is located at amino acid positions 491-509 of the precursor polypeptide set forth in SEQ ID NO:107, and the ω -site is amino acid position 490.

- 5 GPI-anchored PH20 polypeptides such as human PH20 are membrane-bound and, therefore, insoluble. Insoluble forms of PH20 typically are not suitable for therapeutic purposes.

PH20 polypeptides that lack a GPI anchor generally are secreted by cells upon expression because they do not contain a GPI-attachment signal sequence that locks
10 the polypeptide to the membrane. It is found herein that soluble forms of PH20 also include those that contain residues within the GPI-anchor attachment signal sequence. Extended soluble PH20 (esPH20) polypeptides are soluble PH20 proteins that are truncated at the C-terminus but retain one or more amino acid residues located in the GPI-anchor attachment signal sequence of the corresponding wild-type PH20
15 polypeptide. Such esPH20 polypeptides are soluble and can be used as therapeutic polypeptides, such as to treat hyaluronan-associated diseases or conditions and/or to serve as a spreading or dispersing agent to promote, enhance or increase the dispersion and delivery of other agents, drugs and proteins thereby improving the pharmacokinetic and pharmacodynamic profile of the co-administered agent, drug or
20 protein.

1. PH20

PH20, also known as sperm surface protein, sperm adhesion molecule 1, SPAM1 or HYAL3, is a hyaluronidase. Hyaluronidases are a family of enzymes that degrade hyaluronic acid (also known as hyaluronan or hyaluronate or HA), an
25 essential component of the extracellular matrix and a major constituent of the interstitial barrier. By catalyzing the hydrolysis of hyaluronic acid, hyaluronidase lowers the viscosity of hyaluronic acid, thereby increasing tissue permeability. As such, hyaluronidases have been used, for example, as a spreading or dispersing agent in conjunction with other agents, drugs and proteins to enhance their dispersion and
30 delivery, and to improve the pharmacokinetic and pharmacodynamic profile of the co-administered agent, drug or protein.

- 35 -

PH20, like other mammalian hyaluronidases, is an endo- β -N-acetyl-hexosaminidase that hydrolyzes the $\beta 1 \rightarrow 4$ glycosidic bond of hyaluronic acid into various oligosaccharide lengths such as tetrasaccharides and hexasaccharides. PH20 has both hydrolytic and transglycosidase activities and can degrade hyaluronic acid and chondroitin sulfates, such as C4-S and C6-S. PH20 is naturally involved in sperm-egg adhesion and aids penetration by sperm of the layer of cumulus cells by digesting hyaluronic acid. PH20 is located on the sperm surface, and in the lysosome-derived acrosome, where it is bound to the inner acrosomal membrane. Plasma membrane PH20 has hyaluronidase activity only at neutral pH, while inner acrosomal membrane PH20 has activity at both neutral and acidic pH. In addition to being a hyaluronidase, PH20 also appears to be a receptor for HA-induced cell signaling, and a receptor for the zona pellucida surrounding the oocyte.

Exemplary PH20 proteins include, but are not limited to, human (precursor polypeptide set forth in SEQ ID NO:107, mature polypeptide set forth in SEQ ID NO:108), bovine (SEQ ID NOS:111 and 119), rabbit (SEQ ID NO:112), ovine (SEQ ID NOS:113, 118 and 120), Cynomolgus monkey (SEQ ID NO:114), guinea pig (SEQ ID NO:115), rat (SEQ ID NO:116), mouse (SEQ ID NO:117), chimpanzee (SEQ ID NO:197) and Rhesus monkey (SEQ ID NO:198) PH20 polypeptides. The human PH20 mRNA transcript is normally translated to generate a 509 amino acid precursor protein (SEQ ID NO:107) containing a 35 amino acid signal sequence at the N-terminus (amino acid residue positions 1-35 of SEQ ID NO:107). Thus, following transport to the ER and removal of the signal peptide, a 474 amino acid mature polypeptide with an amino acid sequence set forth in SEQ ID NO:108 is produced. As discussed below, a C-terminal peptide is then cleaved in the ER to facilitate covalent attachment of a GPI anchor to the newly-formed C-terminal amino acid at the amino acid position corresponding to position 490 of the precursor polypeptide set forth in SEQ ID NO:107.

Human PH20 is the prototypical neutral-active hyaluronidase that is generally locked to the plasma membrane via a glycosylphosphatidylinositol (GPI) anchor. As noted above, PH20 also is expressed on the inner acrosomal membrane where it has hyaluronidase activity at both neutral and acidic pH. Evidence suggests that the

- 36 -

Peptide 1 region of PH20, which corresponds to amino acids 142-172 of the precursor polypeptide set forth in SEQ ID NO:107, is required for enzyme activity at neutral pH. The Peptide 3 region, which corresponds to amino acids 277-297 of the precursor polypeptide set forth in SEQ ID NO:107, appears to be important for enzyme activity at acidic pH (Cherr et al., (2001) *Matrix Biology* 20:515-525). Thus, it appears that PH20 contains two catalytic sites. In addition to the catalytic sites, PH20 also contains a hyaluronan-binding site. Experimental evidence suggests that this site is located in the Peptide 2 region, which corresponds to amino acid positions 205-235 of the precursor polypeptide set forth in SEQ ID NO:107. This region is highly conserved among hyaluronidases and is similar to the heparin binding motif.

a. Glycosylation

Glycosylation, including N- and O-linked glycosylation, of some hyaluronan degrading enzymes, including hyaluronidases, can be important for their catalytic activity and stability. N-linked oligosaccharides fall into several major types (oligomannose, complex, hybrid), all of which have (Man)₃-GlcNAc-GlcNAc-cores attached via the amide nitrogen of Asn residues that fall within -Asn-Xaa-Thr/Ser-sequences (where Xaa is not Pro). An additional glycosylation site at -Asn-Xaa-Cys- has been reported for coagulation protein C. In some instances, a hyaluronan degrading enzyme, such as a hyaluronidase, can contain both N-glycosidic and O-glycosidic linkages. For example, PH20 has one O-linked oligosaccharide at amino acid T475 as well as six N-linked oligosaccharides at amino acids N82, N166, N235, N254, N368, and N393 of human PH20, exemplified in SEQ ID NO: 107. Amino acid residues N82, N166 and N254 are occupied by complex type glycans whereas amino acid residues N368 and N393 are occupied by high mannose type glycans (see, e.g. Example 6 below). Amino acid residue N235 is occupied by approximately 80% high mannose type glycans and 20% complex type glycans.

While altering the type of glycan modifying a glycoprotein can have dramatic effects on a protein's antigenicity, structural folding, solubility, and stability, most enzymes are not thought to require glycosylation for optimal enzyme activity. For some hyaluronidases, removal of N-linked glycosylation can result in near complete inactivation of the hyaluronidase activity. Thus, for such hyaluronidases, the presence

- 37 -

of N-linked glycans is required for generating an active enzyme. The presence of N-linked glycans in PH20 polypeptides is required for generating an active enzyme. For example, it is found herein, that complete deglycosylation of human PH20, by treatment with the endoglycosidase PNGaseF or the GlcNAc phosphotransferase (GPT) inhibitor tunicamycin, results in the total loss of hyaluronidase activity (see, e.g. Examples 7-8, below). In contrast, partial deglycosylation of human PH20, by treatment with endoglycosidase EndoF1, EndoF2, EndoF3 or EndoH, does not affect the hyaluronidase activity of human PH20 (see, e.g., Example 7, below).

b. GPI-anchoring

Human PH20 is a GPI-anchored protein. As such, the PH20 polypeptide is anchored to the extracellular leaflet of the plasma membrane via a glycosyl-phosphatidylinositol (GPI) anchor attached to the C-terminus of the protein. GPI-anchored proteins such as human PH20 are translated with a cleavable N-terminal signal peptide that directs the protein to the endoplasmic reticulum (ER). At the C-terminus of these proteins is another signal sequence that directs addition of a preformed GPI-anchor to the polypeptide within the lumen of the ER. Addition of the GPI anchor occurs following cleavage of the C-terminal portion at a specific amino acid position, called the ω -site (typically located approximately 20-30 amino acids from the C-terminus). Although there appears to be no consensus sequence to identify the location of the ω -site, GPI anchored proteins contain a C-terminal GPI-anchor attachment signal sequence or domain that typically contains a predominantly hydrophobic region of 8-20 amino acids, preceded by a hydrophilic spacer region of 8-12 amino acids immediately downstream of the ω -site. This hydrophilic spacer region often is rich in charged amino acids and proline (White et al., (2000) *J. Cell Sci.* 113(Pt.4):721-727). More detailed analysis suggests that there is a region of approximately 11 amino acids before the ω -1 position that is characterized by a low amount of predicted secondary structure, a region around the cleavage site (ω -site), from ω -1 to ω +2 that is characterized by the presence of small side chain residues, the spacer region between positions ω +3 and ω +9, and a hydrophobic tail from ω +10 to the C-terminal end (Pierleoni et al., (2008) *BMC Bioinformatics* 9:392).

- 38 -

- Although there is no GPI-anchor attachment signal consensus sequence, various *in silico* methods and algorithms have been developed that can be used to identify such sequences in polypeptides (see, e.g. Udenfriend et al. (1995) *Methods Enzymol.* 250:571-582; Eisenhaber et al., (1999) *J. Biol. Chem.* 272: 741-758;
- 5 Kronegg and Buloz, (1999), "Detection/prediction of GPI cleavage site (GPI-anchor) in a protein (DGPI)," 129.194.185.165/dgpi/; Fankhauser et al., (2005) *Bioinformatics* 21:1846-1852; Omaetxebarria et al., (2007) *Proteomics* 7:1951-1960; Pierleoni et al., (2008) *BMC Bioinformatics* 9:392), including those that are readily available on bioinformatic websites, such as the ExPASy Proteomics tools site (expasy.ch/tools/).
- 10 Thus, one of skill in the art can determine whether a PH20 polypeptide likely contains a GPI-anchor attachment signal sequence, and, therefore, whether the PH20 polypeptide is a GPI-anchored protein.

- The GPI-anchor attachment signal sequence of human PH20 is located at amino acid positions 491-509 of the precursor polypeptide set forth in SEQ ID
- 15 NO:107, and the ω -site is amino acid position 490. Thus, in this modeling of human PH20, amino acids 491-509 are cleaved following transport to the ER and a GPI anchor is covalently attached to the serine residue at position 490. The covalent attachment of a GPI-anchor to the C-terminus of human PH20 and, therefore, the membrane-bound nature of PH20, has been confirmed using phosphatidylinositol-
- 20 specific phospholipase C (PI-PLC) hydrolysis studies (see, e.g., Lin et al., (1994) *J. Biol. Chem.* 269:1157-1163 and Example 3, below). Phosphatidylinositol-specific phospholipase C (PI-PLC) and D (PI-PLD) hydrolyze the GPI anchor, releasing the PH20 polypeptide from the cell membrane. The resulting released PH20 polypeptide is, therefore, soluble. Soluble PH20 can be detected and discriminated from
- 25 insoluble, membrane-bound PH20 using methods well known in the art, including, but not limited to, those using a Triton® X-114 assay, as described below and in Example 4. In this assay, soluble PH20 hyaluronidases partition into the aqueous phase of a Triton® X-114 solution warmed to 37 °C (Bordier et al., (1981) *J. Biol. Chem.*, 256:1604-7) while membrane-anchored PH20 hyaluronidases partition into
- 30 the detergent rich phase. Thus, in addition to using algorithms to assess whether a

- 39 -

PH20 polypeptide is naturally GPI-anchored, solubility experiments also can be performed.

C. Extended Soluble PH20 Polypeptides

Provided herein are extended soluble PH20 (esPH20) polypeptides and compositions. Exemplary of the esPH20 polypeptides provided herein are primate esPH20 polypeptides, including, but not limited to, human and chimpanzee esPH20 polypeptides. The esPH20 polypeptides provided herein are soluble, i.e. secreted, PH20 proteins that are truncated at the C-terminus but retain at least one or more amino acid residues located in the GPI-anchor attachment signal sequence of the corresponding wild-type PH20 polypeptide (e.g. are truncated at amino acid positions 491-500). EsPH20 polypeptides can be produced from any GPI-anchored PH20 polypeptide by modification of the GPI-anchored PH20 polypeptide, that is by removal of a portion of the GPI-anchor attachment signal sequence, provided that the resulting esPH20 polypeptide is soluble. Solubility, or secretion into the cell culture medium, can be determined by SDS-PAGE and western blot analysis upon expression, or alternatively, in a Triton® X-114 assay, as described below and in Example 4, when the PH20 polypeptide is produced by any method known to one of skill in the art, including recombinant expression and polypeptide synthesis. The esPH20 polypeptides provided herein can be used, for example, as therapeutic polypeptides, such as a spreading or dispersing agent in conjunction with other agents, drugs and proteins to enhance their dispersion and delivery, and to improve the pharmacokinetic and pharmacodynamic profile of the co-administered agent, drug or protein.

The esPH20 polypeptides provided herein contain 1, 2, 3, 4, 5, 6, 7 or more amino acid residues from the GPI-anchor attachment signal sequence, providing the esPH20 polypeptide is soluble, i.e., partitions into the aqueous phase of a Triton® X-114 solution, as described below. The extended soluble PH20 polypeptides provided herein can be produced by making C-terminal truncations to any naturally GPI-anchored PH20 polypeptide, wherein the resulting esPH20 polypeptide is soluble and contains 1 or more amino acid residues from the GPI-anchor attachment signal sequence. One of skill in the art can determine whether a PH20 polypeptide is GPI-

- 40 -

anchored using methods well known in the art. Such methods include, but are not limited to, using known algorithms to predict the presence and location of the GPI-anchor attachment signal sequence and ω -site, and performing solubility analyses before and after digestion with phosphatidylinositol-specific phospholipase C (PI-PLC) or D (PI-PLD).

Exemplary esPH20 polypeptides include, but are not limited to, esPH20 polypeptides of primates, such as, for example, human and chimpanzee esPH20 polypeptides. For example, the esPH20 polypeptides provided herein can be made by C-terminal truncation of any of the mature or precursor polypeptides set forth in SEQ ID NOS:107, 108, or 197, or allelic or other variations thereof, including active fragments thereof, wherein the resulting polypeptide is soluble and retains 1 or more amino acid residues from the GPI-anchor attachment signal sequence. Allelic variants and other variants are known to one of skill in the art, and include polypeptides having 60%, 70%, 80%, 90%, 91%, 92%, 93%, 94%, 95% or more sequence identity to any of SEQ ID NOS: 107, 108 and 197. The esPH20 polypeptides provided herein can be C-terminally truncated by 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or more amino acids compared to the wild type polypeptide, such as a polypeptide with a sequence set forth in SEQ ID NOS: 107, 108 and 197, provided the resulting esPH20 polypeptide is soluble and retains 1 or more amino acid residues from the GPI-anchor attachment signal sequence.

The extended soluble PH20 polypeptides provided herein retain hyaluronidase activity. Additionally, the esPH20 polypeptides are neutral active, that is, they retain hyaluronidase activity at neutral pH. The hyaluronidase activity can be increased or decreased compared to the wild-type GPI-anchored form of the PH20. For example, the esPH20 polypeptides provided herein can exhibit hyaluronidase activity that is 1%, 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, 100%, 110%, 120%, 130%, 140%, 150%, 200%, 300%, 400%, 500%, 1000% or more of the hyaluronidase activity exhibited by the wildtype GPI-anchored form.

1. Human esPH20 polypeptides

Exemplary of the esPH20 polypeptides provided herein are human esPH20 polypeptides. The human esPH20 polypeptides provided herein are soluble and

- 41 -

contain 1 or more amino acid residues from the GPI-anchor attachment signal sequence. Thus, provided herein are soluble forms of human PH20 that GPI do not completely lack the GPI-anchor attachment signal sequence.

Precursor human esPH20 polypeptides provided herein include, but are not
5 limited to, those having C-terminal truncations to generate polypeptides containing amino acid 1 to amino acid 491, 492, 493, 494, 495, 496, 497, 498, 499 or 500 of the sequence of amino acids set forth in SEQ ID NO: 107. When expressed in mammalian cells, the 35 amino acid N-terminal signal sequence is cleaved during processing, and the mature form of the protein is secreted. Thus, the mature human
10 esPH20 polypeptides contain amino acids 36 to 491, 492, 493, 494, 495, 496, 497, 498, 499 or 500 of SEQ ID NO:107. Hence, mature human esPH20 polypeptides provided herein include those set forth in SEQ ID NOS: 59-63 and 100-104, or allelic or other variants thereof.

The human esPH20 polypeptides provided herein can be expressed in CHO
15 cells, or alternatively produced in any cell or by any method known to one of skill in the art, provided they are soluble and contain at least one amino acid from the GPI-anchor attachment signal sequence. Soluble human esPH20 polypeptides produced in CHO cells are those that are secreted into the cell culture medium. It is understood by one of skill in the art that a human esPH20 can be partially secreted, that is, 50%,
20 55%, 60%, 65%, 70%, 75%, 80%, 85%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more of the expressed polypeptide is secreted into the culture medium, provided that the secreted esPH20 is soluble, i.e., partitions into the aqueous phase of a Triton® X-114 solution, as described below. Human esPH20 polypeptides provided herein that contain amino acids 1-500, or 36-500, are partially secreted.
25 Additionally, when expressed in CHO cells, the precursor human esPH20 polypeptides containing amino acids 1 to 498, 499 or 500, or the mature human esPH20 polypeptides containing amino acids 36 to 498, 499 or 500, are weakly expressed (see, e.g., Example 3 below).

Thus, exemplary precursor human esPH20 polypeptides include, but are not
30 limited to, any having C-terminal truncations to generate polypeptides containing amino acid 1 to amino acid 491, 492, 493, 494, 495, 496 or 497 of the sequence of

- 42 -

amino acids set forth in SEQ ID NO: 107. When expressed in mammalian cells, following cleavage of the N-terminal signal peptide during processing, mature human esPH20 polypeptides contain amino acids 36 to 491, 492, 493, 494, 495, 496 or 497 of SEQ ID NO:107. Hence, exemplary mature human esPH20 polypeptides provided
5 herein include those that are 456, 457, 458, 459, 460, 461 or 462 amino acids in length, such as set forth in any of SEQ ID NOS: 60-63 and 102-104, or allelic or other variants thereof. Allelic variants and other variants are known to one of skill in the art, and include polypeptides having 60%, 70%, 80%, 90%, 91%, 92%, 93%, 94%, 95% or more sequence identity to any of SEQ ID NOS: 107 or 108.

10 Also provided herein are amino acid-substituted human esPH20 polypeptides, Amino acid substituted esPH20 polypeptides are human esPH20 polypeptides that are modified such that they contain amino acid substitutions, as compared to the human esPH20 polypeptides provided herein, for example, as set forth in SEQ ID NOS: 60-63 and 102-104. Thus, amino acid-substituted human esPH20 polypeptides are those
15 having C-terminal truncations. In some examples, the amino acid substituted human esPH20 polypeptides provided herein have at least 50%, 55%, 60%, 65%, 70%, 75%, 80%, 85%, 87%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more sequence identity with the sequence of amino acids set forth as amino acids 1 to 491, 492, 493, 494, 495, 496 or 497, or amino acids 36 to 491, 492, 493, 494, 495, 496 or
20 497, of the sequence of amino acids set forth in SEQ ID NO: 107. In other examples, the amino acid substituted human esPH20 polypeptides have 85%, 87%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more sequence identity with the sequence of amino acids set forth as in SEQ ID NOS: 60-63 and 102-104.

The human esPH20 polypeptides provided herein can exhibit hyaluronidase
25 activity that is increased or decreased compared to the wild-type GPI-anchored form of PH20. For example, the human esPH20 polypeptides provided herein can exhibit hyaluronidase activity that is 1%, 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, 100%, 110%, 120%, 130%, 140%, 150%, 200%, 300%, 400%, 500%, 1000% or more of the hyaluronidase activity exhibited by the wildtype GPI-anchored form. In some
30 examples, human esPH20 polypeptides exhibit increased hyaluronidase activity compared to the wildtype GPI-anchored form. The hyaluronidase activity of human

- 43 -

esPH20 polypeptides can be increased by 1%, 2%, 3%, 4%, 5%, 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, 100%, 110%, 120%, 130%, 140%, 150%, 200%, 300%, 400%, 500%, 1000% or more compared to the hyaluronidase activity of the wildtype GPI-anchored form.

5 The human esPH20 polypeptides provided herein exhibit neutral active hyaluronidase activity, or hyaluronidase activity when measured at neutral pH, that is increased or decreased compared to the the compared to the wild-type GPI-anchored form of PH20. For example, the human esPH20 polypeptides provided herein can exhibit hyaluronidase activity that is 1%, 10%, 20%, 30%, 40%, 50%, 60%, 70%,
 10 80%, 90%, 100%, 110%, 120%, 130%, 140%, 150%, 200%, 300%, 400%, 500%, 1000% or more of the hyaluronidase activity exhibited by the wildtype GPI-anchored form. In some examples, human esPH20 polypeptides exhibit decreased neutral active hyaluronidase activity compared to the wildtype GPI-anchored form. The neutral active hyaluronidase activity can be decreased by 1%, 2%, 3%, 4%, 5%, 10%,
 15 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, 95% or more compared to the neutral active hyaluronidase activity of the wildtype GPI-anchored form. In other examples, human esPH20 polypeptides exhibit increased neutral active hyaluronidase activity compared to the wildtype GPI-anchored form. The neutral active hyaluronidase activity can be increased by 1%, 2%, 3%, 4%, 5%, 10%, 20%, 30%, 40%, 50%, 60%,
 20 70%, 80%, 90%, 100%, 110%, 120%, 130%, 140%, 150%, 200%, 300%, 400%, 500%, 1000% or more compared to the neutral active hyaluronidase activity of the wildtype GPI-anchored form.

Typically, human esPH20 polypeptides are produced using protein expression systems that facilitate correct N-glycosylation to ensure the polypeptide retains
 25 activity, since glycosylation is important for the catalytic activity and stability of these polypeptides. Exemplary cells useful for recombinant expression of esPH20 polypeptides include, for example Chinese Hamster Ovary (CHO) cells (*e.g.* DG44 CHO or CHO-S cells).

2. Other species esPH20 polypeptides

30 Provided herein are non-human extended soluble PH20 polypeptides. One of skill in art can align the amino acid sequence of human PH20 with any non-human

- 44 -

PH20 polypeptide to identify positions corresponding to positions 491-500 of the human PH20 polypeptide set forth in SEQ ID NO:107, and at which C-terminal truncations can be made to produce extended soluble PH20 polypeptides.

Additionally, algorithms, such as those described elsewhere herein, can be used to predict the location of the GPI-anchor attachment signal sequence. The solubility of the C-terminally truncated polypeptides can be assessed using methods well known in the art, including the Triton® X-114 assays described below and in Example 4, to determine whether the produced C-terminally truncated polypeptides are soluble and, therefore, esPH20 polypeptides.

Provided herein are extended soluble PH20 polypeptides of non-human primate species. Exemplary non-human primate GPI-anchored PH20 polypeptides include, but are not limited to, chimpanzee PH20 (SEQ ID NO:197). Thus, provided herein are chimpanzee esPH20 polypeptides. The esPH20 polypeptides of chimpanzee provided herein contain C-terminal truncations that correspond to the C-terminal truncations described above for the human esPH20 polypeptides. Thus, the chimpanzee esPH20 polypeptides provided herein contain amino acids corresponding to amino acid residues 1 to 491, 492, 493, 494, 495, 496, 497, 498, 499, 500 or 501 of the sequence of amino acids set forth in SEQ ID NO: 107.

The chimpanzee PH20 polypeptides can be aligned to the human PH20 polypeptide by any method known to those of skill in the art. Such methods typically maximize matches, and include methods such as using manual alignments and by using the numerous alignment programs available (for example, BLASTP) and others known to those of skill in the art. Figure 1 provides an alignment of the precursor polypeptides of human and chimpanzee PH20. Amino acid residues 491 to 500 of the human PH20 (at which the human esPH20 polypeptides provided herein are truncated compared to the wild-type human PH20 polypeptide) correspond to amino acid residues 491 to 501 of chimpanzee PH20. Thus, provided herein are chimpanzee esPH20 polypeptides that contain amino acid residues 1 to 491, 492, 493, 494, 495, 496, 497, 498, 499, 500 or 501 of the sequence of amino acids set forth in SEQ ID NO: 197. When expressed in a mammalian expression system, the 35 amino acid signal peptide is cleaved during processing, and the mature form of the protein is

- 45 -

secreted. Thus, the mature chimpanzee esPH20 polypeptides contain amino acids 36 to 491, 492, 493, 494, 495, 496, 497, 498, 499, 500 or 501 of SEQ ID NO:197.

Exemplary chimpanzee esPH20 polypeptide are those that contain amino acids residues 1 to 491, 492, 493, 494, 495, 496, 497 or 498 of the sequence of amino acids set forth in SEQ ID NO:197. When expressed in a mammalian expression system, the 5 amino acid signal peptide is cleaved during processing, and the mature form of the protein is secreted. Thus, the mature chimpanzee esPH20 polypeptides contain amino acids 36 to 491, 492, 493, 494, 495, 496, 497, or 498 of SEQ ID NO:197.

D. N-Partially glycosylated PH20 polypeptides

10 Provided herein are N-partially glycosylated hyaluronidases, including partially deglycosylated PH20 polypeptides, that retain all or a portion of the hyaluronidase activity of an N-glycosylated hyaluronidase. Exemplary partially deglycosylated hyaluronidases include partially deglycosylated PH20 polypeptides from any species, such as any set forth in any of SEQ ID NOS:107-109, 111-120, 197 and 198, or allelic variants or other variants thereof. Allelic variants and other 15 variants are known to one of skill in the art, and include polypeptides having 60%, 70%, 80%, 90%, 91%, 92%, 93%, 94%, 95% or more sequence identity to any of SEQ ID NOS: NOS:107-109, 111-120, 197 and 198, or truncated forms thereof. The partially deglycosylated hyaluronidases provided herein also include hybrid, fusion 20 and chimeric partially deglycosylated hyaluronidases, and partially deglycosylated hyaluronidase conjugates.

The N-partially glycosylated hyaluronidases provided herein can be produced by digestion with one or more glycosidases. Thus, although all N-linked glycosylation sites (such as, for example, those at amino acids N82, N166, N235, 25 N254, N368, and N393 of human PH20, exemplified in SEQ ID NO:107) can be glycosylated, the extent of glycosylation is reduced compared to a hyaluronidase that is not digested with one or more glycosidases. The partially deglycosylated hyaluronidase polypeptides provided herein, including partially deglycosylated soluble PH20 polypeptides, can have 10%, 20%, 30%, 40%, 50%, 60%, 70% or 80% 30 of the level of glycosylation of a fully glycosylated hyaluronidase. In one example, 1, 2, 3, 4, 5 or 6 of the N-glycosylation sites corresponding to amino acids N82, N166,

- 46 -

N235, N254, N368, and N393 of SEQ ID NO: 107 are partially deglycosylated, such that they no longer contain high mannose or complex type glycans, but rather contain at least an N-acetylglucosamine moiety. In some examples, 1, 2 or 3 of the N-glycosylation sites corresponding to amino acids N82, N166 and N254 of SEQ ID NO: 107 are deglycosylated, that is, they do not contain a sugar moiety. In other examples, 3, 4, 5, or 6 of the N-glycosylation sites corresponding to amino acids N82, N166, N235, N254, N368, and N393 of SEQ ID NO: 107 are glycosylated. Glycosylated amino acid residues minimally contain an N-acetylglucosamine moiety.

Also provided herein are N-partially glycosylated C-terminally truncated PH20 polypeptides. The partially deglycosylated C-terminally truncated PH20 polypeptides provided herein lack one or more amino acids from the C-terminus of a full length PH20 polypeptide, such as any of those set forth in SEQ ID NOS:107-109, 111-120, 197 and 198. Thus, the N-partially glycosylated C-terminally truncated PH20 polypeptides provided herein can be C-terminally truncated by 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 25, 30, 35, 40, 45, 50, 55, 60 or more amino acids compared to the full length wild type polypeptide, such as a full length wild type polypeptide with a sequence set forth in SEQ ID NOS:107-109, 111-120, 197 and 198. In some examples, 3, 4, 5, or 6 of the N-glycosylation sites corresponding to amino acids N82, N166, N235, N254, N368, and N393 of SEQ ID NO: 107 are glycosylated. Glycosylated amino acid residues minimally contain an N-acetylglucosamine moiety. In other examples, 1, 2 or 3 of the N-glycosylation sites corresponding to amino acids N82, N166, N235, N254, N368, and N393 of SEQ ID NO: 107 are not glycosylated. In further examples, the extent of glycosylation can be reduced, such that, the partially glycosylated C-terminally truncated PH20 polypeptides do not contain high mannose and complex type glycans, rather they contain at least an N-acetylglucosamine moiety, so long as they retain hyaluronidase activity. Thus the partially deglycosylated C-terminally truncated PH20 polypeptides provided herein can have 10%, 20%, 30%, 40%, 50%, 60%, 70% or 80% of the level of glycosylation of a fully glycosylated C-terminally truncated PH20 polypeptide. The partially deglycosylated PH20 polypeptides and C-terminally truncated PH20 polypeptides provided herein retain hyaluronidase activity. Additionally, the

- 47 -

partially deglycosylated PH20 polypeptides and C-terminally truncated PH20 polypeptides are neutral active, that is, they retain hyaluronidase activity at neutral pH. The hyaluronidase activity can be increased or decreased compared to the glycosylated full length and C-terminally truncated PH20 polypeptides. For example, the partially deglycosylated PH20 polypeptides and C-terminally truncated PH20 polypeptides provided herein can exhibit hyaluronidase activity that is 1%, 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, 100%, 110%, 120%, 130%, 140%, 150%, 200%, 300%, 400%, 500%, 1000% or more of the hyaluronidase activity exhibited by the glycosylated full length and C-terminally truncated PH20 polypeptides.

Thus, the PH20 polypeptides provided herein can be used as therapeutic polypeptides, such as to treat hyaluronan-associated diseases or conditions. The partially deglycosylated PH20 polypeptides and C-terminally truncated PH20 polypeptides also can be used, for example, in combination therapy.

1. PH20 polypeptides

Exemplary N-partially glycosylated hyaluronidases provided herein include partially deglycosylated PH20 polypeptides from any species, such as any set forth in any of SEQ ID NOS:107-109, 111-120, 197 and 198, or allelic variants or other variants thereof. Allelic variants and other variants are known to one of skill in the art, and include polypeptides having 60%, 70%, 80%, 90%, 91%, 92%, 93%, 94%, 95% or more sequence identity to any of SEQ ID NOS: NOS:107-109, 111-120, 197 and 198, or truncated forms thereof. In some examples, 3, 4, 5, or 6 of the N-glycosylation sites corresponding to amino acids N82, N166, N235, N254, N368, and N393 of SEQ ID NO: 107 are glycosylated. In other examples, 1, 2, or 3 of the N-glycosylation sites corresponding to amino acids N82, N166 and N254 of SEQ ID NO: 107 are not glycosylated. In some examples, 1, 2, 3, 4, 5, or 6 of the N-glycosylation sites corresponding to amino acids N82, N166, N235, N254, N368, and N393 of SEQ ID NO: 107 minimally contain an N-acetylglucosamine moiety.

The partially deglycosylated hyaluronidases provided herein can be produced by digestion with one or more glycosidases. Thus, although all N-linked glycosylation sites (such as, for example, those at amino acids N82, N166, N235, N254, N368, and N393 of human PH20, exemplified in SEQ ID NO:107) can be

- 48 -

glycosylated, the extent of glycosylation is reduced compared to a hyaluronidase that is not digested with one or more glycosidases. In particular, partially glycosylated hyaluronidases retain at least an N-acetylglucosamine moiety at each of the N-linked glycosylation sites. Partially glycosylated hyaluronidases can be glycosylated at 3, 4, 5, or 6 of the N-glycosylation sites corresponding to amino acids N82, N166, N235, N254, N368, and N393 of SEQ ID NO: 107. In some examples, the hyaluronidases are deglycosylated at 1, 2, or 3 of the N-glycosylation sites corresponding to amino acid residues N82, N166, N235, N254, N368, and N393 of SEQ ID NO: 107. The partially deglycosylated PH20 polypeptides provided herein can have 10%, 20%, 30%, 40%, 50%, 60%, 70% or 80% of the level of glycosylation of a fully glycosylated hyaluronidase.

Glycosidases, or glycoside hydrolases, are enzymes that catalyze the hydrolysis of the glycosidic linkage to generate two smaller sugars. As shown in Figure 2, the major types of N-glycans in vertebrates include high mannose glycans, hybrid glycans and complex glycans. There are several glycosidases that result in only partial protein deglycosylation, including: EndoF1, which cleaves high mannose and hybrid type glycans; EndoF2, which cleaves biantennary complex type glycans; EndoF3, which cleaves biantennary and more branched complex glycans; and EndoH, which cleaves high mannose and hybrid type glycans (Figure 3). Treatment of a hyaluronidase, such as a soluble hyaluronidase, such as a soluble PH20, with one or all of these glycosidases results can result in only partial deglycosylation and, therefore, retention of hyaluronidase activity.

For example, treatment of rHuPH20 with one or all of these glycosidases results in partial deglycosylation. These partially deglycosylated rHuPH20 polypeptides exhibit hyaluronidase enzymatic activity that is comparable to the fully glycosylated polypeptides (see e.g. Example 7). In contrast, treatment of rHuPH20 (SEQ ID NO:122) with PNGaseF, a glycosidase that cleaves all N-glycans (see Figure 3), or treatment with the GlcNAc phosphotransferase (GPT) inhibitor tunicamycin, results in complete deglycosylation of all N-glycans and thereby renders PH20 enzymatically inactive (see e.g., Examples 7-8, below).

- 49 -

The partially deglycosylated hyaluronidase polypeptides provided herein, including partially deglycosylated soluble PH20 polypeptides, can have 10%, 20%, 30%, 40%, 50%, 60%, 70% or 80% of the level of glycosylation of a fully glycosylated hyaluronidase. Typically, the partially deglycosylated hyaluronidases, including partially deglycosylated soluble PH20 polypeptides, provided herein exhibit hyaluronidase activity that is 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, 100%, 110%, 120%, 130%, 140%, 150%, 200%, 300%, 400%, 500%, 1000% or more of the hyaluronidase activity exhibited by the fully glycosylated hyaluronidase.

The partially deglycosylated hyaluronidases provided herein also include hybrid, fusion and chimeric partially deglycosylated hyaluronidases, and partially deglycosylated hyaluronidase conjugates.

2. C-terminally truncated PH20 polypeptides

Exemplary of the N-partially glycosylated, or partially deglycosylated, PH20 peptides provided herein are C-terminally truncated PH20 polypeptides. The partially glycosylated C-terminally truncated PH20 polypeptides provided herein lack one or more amino acids from the C-terminus of the full length PH20 polypeptide as set forth in SEQ ID NOS:107-109, 111-120, 197 and 198. Thus, the partially glycosylated C-terminally truncated PH20 polypeptides provided herein can be C-terminally truncated by 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 25, 30, 35, 40, 45, 50, 55, 60 or more amino acids compared to the full length wild type polypeptide, such as a full length wild type polypeptide with a sequence set forth in SEQ ID NOS:107-109, 111-120, 197 and 198. In some examples, 3, 4, 5, or 6 of the N-glycosylation sites, corresponding to amino acids N82, N166, N235, N254, N368, and N393 of SEQ ID NO: 107, are glycosylated. In other examples, 1, 2, or 3 of the N- glycosylation sites, corresponding to amino acids N82, N166 and N254 of SEQ ID NO: 107, are not glycosylated.

The partially deglycosylated C-terminally truncated PH20 polypeptides provided herein can be produced by digestion with one or more glycosidases. Although all N-linked glycosylation sites (such as, for example, those at amino acids N82, N166, N235, N254, N368, and N393 of human PH20, exemplified in SEQ ID NO:107) can be glycosylated, the extent of glycosylation is reduced compared to a

- 50 -

hyaluronidase that is not digested with one or more glycosidases. Thus, the partially deglycosylated C-terminally truncated PH20 polypeptides provided herein can have 10%, 20%, 30%, 40%, 50%, 60%, 70% or 80% of the level of glycosylation of a fully glycosylated hyaluronidase. In particular, N-partially glycosylated hyaluronidases

5 retain at least an N-acetylglucosamine moiety at each of the N-linked glycosylation sites. In some examples, 1, 2, 3, 4, 5, or 6 of the N-glycosylation sites corresponding to amino acids N82, N166, N235, N254, N368, and N393 of SEQ ID NO: 107 minimally contain an N-acetylglucosamine moiety. In other examples, 3, 4, 5, or 6 of the N-glycosylation sites corresponding to amino acids N82, N166, N235, N254,

10 N368, and N393 of SEQ ID NO: 107 are glycosylated at the level of glycosylation of a fully glycosylated hyaluronidase at each of the 3, 4, 5, or 6 N-glycosylation sites. In further examples, 1, 2, or 3 of the the N-glycosylation sites corresponding to amino acids N82, N166, N235, N254, N368, and N393 of SEQ ID NO: 107 are fully deglycosylated. In these examples, typically, amino acids N82, N166 or N254 are

15 fully deglycosylated.

Exemplary N-partially glycosylated C-terminally truncated PH20 polypeptides are from any species, such as any set forth in any of SEQ ID NOS: 107-109, 111-120, 197 and 198, or allelic variants or other variants thereof. Allelic variants and other variants are known to one of skill in the art, and include polypeptides having 60%,

20 70%, 80%, 90%, 91%, 92%, 93%, 94%, 95% or more sequence identity to any of SEQ ID NOS: NOS:107-120, 197 and 198, or truncated forms thereof. The N-partially glycosylated C-terminally truncated PH20 polypeptides provided herein also include hybrid, fusion and chimeric PH20 polypeptides, and PH20 conjugates. For example, the partially deglycosylated C-terminally truncated PH20 polypeptides

25 provided herein can be conjugated to a polymer, such as dextran, a polyethylene glycol (pegylation (PEG)) or sialyl moiety, or other such polymers, such as natural or sugar polymers. In other examples, the N-partially glycosylated C-terminally truncated PH20 polypeptide is linked or fused to a domain such as an Fc domain from an IgG immunoglobulin.

30 Included amongst the glycosylated or partially glycosylated C-terminally truncated polypeptides provided herein are those that are truncated at the C-terminus

- 51 -

by 2 amino acids up to 44 amino acids compared to the wild type PH20 set forth in SEQ ID NO:107 (precursor polypeptide) or 108 (mature polypeptide), or allelic or species variants thereof. Thus, C-terminally truncated PH20 polypeptides include any having C-terminal truncations to generate polypeptides containing amino acid 1 to

5 amino acid 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506 or 507 of the sequence of amino acids set forth in SEQ ID NO: 107, or corresponding positions in an allelic or species variant thereof,

10 with 2, 3, 4, 5, or 6 of the N-glycosylation sites, corresponding to amino acids N82, N166, N235, N254, N368, and N393 of SEQ ID NO: 107, glycosylated. When expressed in mammalian cells, the 35 amino acid N-terminal signal sequence is cleaved during processing, and the mature form of the protein is secreted. Thus, provided herein are mature C-terminally truncated PH20 polypeptides that contain

15 amino acids 36 to 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506 or 507 of the sequence of amino acids set forth in SEQ ID NO: 107 or corresponding positions in an allelic or species

20 variant thereof, with 3, 4, 5, or 6 of the N-glycosylation sites, corresponding to amino acids N82, N166, N235, N254, N368, and N393 of SEQ ID NO: 107, glycosylated.

Table 2 provides non-limiting examples of exemplary C-terminally truncated PH20 polypeptides that can be glycosylated or partially deglycosylated. In Table 2 below, the length (in amino acids) of the precursor and mature polypeptides, and the

25 sequence identifier (SEQ ID NO) in which exemplary amino acid sequences of the precursor and mature polypeptides of the C-terminally truncated PH20 proteins are set forth, are provided. The wild-type PH20 polypeptide also is included in Table 2 for comparison.

Table 2. Exemplary C-terminally truncated PH20 polypeptides

The N-glycosylated and partially deglycosylated C-terminal truncated PH20 polypeptides provided herein include those that are soluble, i.e. partition into the aqueous phase of a Triton® X-114 solution, and those that are insoluble, i.e. partition into the detergent phase of a Triton® X-114 solution. The partially deglycosylated C-terminally truncated PH20 polypeptides provided herein can have 10%, 20%, 30%, 40%, 50%, 60%, 70% or 80% of the level of glycosylation of a fully glycosylated hyaluronidase. Alternatively, the partially deglycosylated C-terminal truncated PH20 polypeptides can have 1, 2 or 3 of the N-glycosylation sites, corresponding to amino acids N82, N166 and N254 of SEQ ID NO: 107, that are not glycosylated. Minimally, to be glycosylated, an N-glycosylation site contains at least an N-acetylglucosamine moiety.

In some examples, the N-partially glycosylated C-terminally truncated polypeptides provided herein are soluble, i.e., are not GPI-anchored. This can be assessed, for example, using a Triton® X-114 assay following incubation with PI-PLC or PI-PLD, as described below and in Example 4. For example, PH20 polypeptides that are C-terminally truncated at or 5' to the amino acid position corresponding to amino acid residue position 490 of the PH20 polypeptide set forth in SEQ ID NO:107 typically are soluble when expressed in a mammalian expression system (see, e.g. Example 3). These polypeptides are soluble by virtue of the fact that they completely lack the GPI-anchor attachment signal sequence. In other examples, the partially glycosylated C-terminally truncated polypeptides provided herein are insoluble and membrane-bound when expressed in a mammalian expression system. For example, PH20 polypeptides that are C-terminally truncated at or 3' of the amino acid position corresponding to amino acid position 500 of the PH20 polypeptide set forth in SEQ ID NO:107 typically are insoluble when expressed in a mammalian expression system (see, e.g. Example 3). The C-terminally truncated polypeptides

- 54 -

provided herein can be partially glycosylated in that 3, 4, 5, or 6 of the N-glycosylation sites corresponding to amino acids N82, N166, N235, N254, N368, and N393 of SEQ ID NO: 107 are glycosylated.

Soluble partially glycosylated C-terminal truncated PH20 polypeptides provided herein include those that are truncated but retain at least one or more amino acid residues located in the GPI-anchor attachment signal, and those that completely lack the GPI-anchor attachment signal sequence and the ω -site. Thus, instead of having a GPI-anchor covalently attached to the C-terminus of the protein in the ER and being anchored to the extracellular leaflet of the plasma membrane, these polypeptides are secreted. These C-terminal truncated soluble PH20 polypeptides can be partially glycosylated such that 3, 4, 5, or 6 of the N-glycosylation sites are glycosylated. Exemplary soluble C-terminally truncated PH20 polypeptides that lack the GPI-anchor attachment signal sequence are from any species, such as any set forth in any of SEQ ID NOS: 107-109, 111-120, 197 and 198, or allelic variants or other variants thereof. These partially glycosylated soluble C-terminal truncated PH20 polypeptides have C-terminal truncations to generate polypeptides containing amino acids 1 to 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499 or 500 of the sequence of amino acids set forth in SEQ ID NO: 107. Upon cleavage of the N-terminal signal sequence following expression in mammalian cells, the mature partially glycosylated soluble C-terminal truncated PH20 polypeptides contain amino acids 36 to 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499 or 500 of the sequence of amino acids set forth in SEQ ID NO: 107. In some examples, the C-terminally GPI-anchor signal sequence truncated soluble PH20 polypeptides are partially glycosylated, containing, for example, at least an N-acetylglucosamine at 3, 4, 5, or 6 of the N-glycosylation sites corresponding to amino acids N82, N166, N235, N254, N368, and N393 of SEQ ID NO: 107. In other examples, the C-terminally GPI-anchor signal sequence truncated

- 55 -

soluble PH20 polypeptides have 10%, 20%, 30%, 40%, 50%, 60%, 70% or 80% of the level of glycosylation of a fully glycosylated hyaluronidase.

Partially deglycosylated C-terminal truncated PH20 polypeptides that retain at least one amino acid in the GPI-anchor attachment signal sequence provided herein are partially deglycosylated extended soluble PH20 polypeptides. In some examples, the partially deglycosylated C-terminal truncated PH20 polypeptides are not glycosylated at 1, 2 or 3 of the N-glycosylation sites corresponding to amino acids N82, N166 and N254 of SEQ ID NO: 107. These partially deglycosylated extended soluble PH20 polypeptides contain amino acids 1 to 491, 492, 493, 494, 495, 496, 497, 498, 499 or 500 of the sequence of amino acids set forth in SEQ ID NO: 107. When expressed in mammalian cells, the 35 amino acid N-terminal signal sequence is cleaved during processing, and the mature form of the protein is secreted. Thus, the mature form of the partially deglycosylated esPH20 polypeptides contain amino acids 36 to 491, 492, 493, 494, 495, 496, 497, 498, 499 or 500 of the sequence of amino acids set forth in SEQ ID NO: 107. Mature human forms of partially glycosylated esPH20 polypeptides provided herein include those set forth in SEQ ID NOS: 59-63 and 100-104 containing at least an N-acetylglucosamine at 3, 4, 5 or 6 of the N-glycosylation sites corresponding to amino acids N82, N166, N235, N254, N368, and N393 of SEQ ID NO: 107. In some examples, the extent of glycosylation is reduced by treatment with an endoglycosidase. Thus, the partially deglycosylated C-terminally truncated PH20 polypeptides that contain at least one amino acid in the GPI-anchor attachment signal sequence provided herein can have 10%, 20%, 30%, 40%, 50%, 60%, 70% or 80% of the level of glycosylation of a fully glycosylated hyaluronidase.

Also provided herein are partially deglycosylated C-terminally truncated PH20 polypeptides that are not soluble, that is, they are attached to the cell membrane and therefore not secreted into the media upon expression. The C-terminal truncated PH20 polypeptides that are not soluble can be partially deglycosylated as long as they retain hyaluronidase activity. Exemplary partially glycosylated mature C-terminally truncated PH20 polypeptides that are not soluble are those that contain amino acids corresponding to amino acid positions 36 to 501, 502, 503, 504, 505, 506 or 507 of SEQ ID NO:107. Hence, partially glycosylated C-terminally truncated PH20

- 56 -

polypeptides provided herein that are not soluble include those that are 466, 467, 468, 469, 470, 471 or 472 amino acids in length, such as those set forth in SEQ ID NOS: 55-58 and 97-99, that retain at least 10%, 20%, 30%, 40%, 50%, 60%, 70% or 80% of the level of glycosylation of a fully glycosylated hyaluronidase. In some examples, 3, 4, 5, or 6 of the N-glycosylation sites corresponding to amino acids N82, N166, N235, N254, N368, and N393 of SEQ ID NO: 107 are glycosylated. In other examples, the 1, 2, 3, 4, 5 or 6 of the N-glycosylation sites, corresponding to amino acids N82, N166, N235, N254, N368, and N393 of SEQ ID NO: 107, contain at least an N-acetylglucosamine moiety.

10 The partially glycosylated C-terminally truncated polypeptides provided herein can exhibit hyaluronidase activity that is increased or decreased compared to the wild-type GPI-anchored form of the PH20. Additionally, the partially deglycosylated C-terminally truncated PH20 polypeptides are neutral active, that is, they retain hyaluronidase activity at neutral pH. For example, the C-terminal truncated PH20 polypeptides provided herein can exhibit hyaluronidase activity that is 15 1%, 10%, 20%, 30%, 40%, 50%, 60%, 70%, 80%, 90%, 100%, 110%, 120%, 130%, 140%, 150%, 200%, 300%, 400%, 500%, 1000% or more of the hyaluronidase activity exhibited by the wildtype GPI-anchored form. In some examples, partially glycosylated C-terminal truncated PH20 polypeptides exhibit increased hyaluronidase activity compared to the wildtype GPI-anchored form.

20 The C-terminal truncated PH20 polypeptides provided herein may also be N-glycosylated. The N-glycosylated and N-partially glycosylated hyaluronidases provided herein also include hybrid, fusion and chimeric N-glycosylated and partially deglycosylated hyaluronidases, and N-glycosylated and partially deglycosylated hyaluronidase conjugates.

3. Additional Modifications

30 The PH20 polypeptides included herein, including human esPH20 polypeptides, N-glycosylated and N-partially glycosylated C-terminally truncated PH20 polypeptides and partially glycosylated PH20 polypeptides, also include those that contain chemical or posttranslational modifications and those that do not contain chemical or posttranslational modifications. Such modifications include, but are not

- 57 -

limited to, pegylation, sialation, albumination, glycosylation, farnesylation, carboxylation, hydroxylation, phosphorylation, and other polypeptide modifications known in the art. Thus, C-terminally truncated PH20 polypeptides, including esPH20 polypeptides, provided herein can contain other modifications that are or are not in the primary sequence of the polypeptide, including, but not limited to, of a carbohydrate moiety, a polyethylene glycol (PEG) moiety, a sialation moiety, an Fc domain from immunoglobulin G, or any other domain or moiety. For example, such additional modifications can be made to increase the stability or serum half-life of the protein. The C-terminally truncated PH20 polypeptides, including esPH20 polypeptides, provided herein can be conjugated or fused to any moiety using any method known in the art, including chemical and recombinant methods, providing the resulting polypeptide retains hyaluronidase activity.

Decreased immunogenicity

The PH20 polypeptides provided herein, including the human esPH20 polypeptides, can be made to have decreased immunogenicity. Decreased immunogenicity can be effected by sequence changes that eliminate antigenic epitopes from the polypeptide or by altering post-translational modifications. For example, altering the glycosylation of the peptide is contemplated, so long as the polypeptides minimally contain at least N-acetylglucosamine at amino acid residues N235, N368 and N393 of SEQ ID NO:107.

For example, the PH20 polypeptides can be modified such that they lack fucose, particularly bifucosylation.. In particular, the PH20 polypeptides provided herein are not bifucosylated. This can be achieved by expressing and producing the PH20 polypeptide in a host cells, typically insect host cells, that do not effect bifucosylation. Fucose is a deoxyhexose that is present in a wide variety of organisms, including mammals, insects and plants. Fucosylated glycans are synthesized by fucosyl-transferases. See, e.g., Ma et al., *Glycobiology*, 15(2):158R-184R, (2006); Nakayama et al., *J. Biol. Chem.*, 276:16100-16106 (2001); and Sturla et al., *Glycobiology*, 15(10):924-935 (2005). In humans, fucose frequently exists as a terminal modification to glycan structures, and the presence of fucose α 1,6-linked to N-acetylglucosamine has been shown to be important in glycoprotein processing and

- 58 -

recognition. In insects, N-glycan core structures exhibit bifucosylation with α 1,6- and α 1,3-linkages. Insect cell core fucosylation with α 1,3-linkages generates a carbohydrate epitope that is immunogenic in humans (see, e.g., US Patent Application No. 20070067855). For example, PH20 polypeptides provided herein, including
5 esPH20 polypeptides, can be generated in host cells that are incapable of bifucosylating the polypeptide. Thus, while insect cells or other cells that bifucosylate can be used for expression of the polypeptides, typically mammalian cells, such as CHO cells, are used.

In some examples, defucosylated, or fucose-deficient PH20 polypeptides can
10 be generated in insect cells with modified glycosylation pathways, through the use of baculovirus expression vectors containing eukaryotic oligosaccharide processing genes, thereby creating “mammalianized” insect cell expression systems (see, e.g., US Patent No. 6,461,863). Alternatively, antigenicity can be eliminated by expression of PH20 polypeptides in insect cells lacking α 1,3-fucosyltransferase (FT3) (see, e.g., US
15 Patent Application No. 20070067855). In other examples, defucosylated or fucose-deficient PH20 polypeptides can be generated, for example, in cell lines that produce defucosylated proteins, including Lec13 CHO cells deficient in protein fucosylation (Ripka et al. *Arch. Biochem. Biophys.* 249:533-545 (1986); U.S. Pat. Appl. No. 2003/0157108; and WO 2004/056312), and knockout cell lines, such as alpha-1,6-
20 fucosyltransferase gene, FUT8, knockout CHO cells (Yamane-Ohnuki et al. *Biotech. Bioeng.* 87: 614 (2004)).

Conjugation to polymers

In some examples, the esPH20 polypeptides and other C-terminally truncated PH20 polypeptides, including partially glycosylated PH20 polypeptides, provided
25 herein are conjugated to polymers. Exemplary polymers that can be conjugated to the PH20 polypeptides, include natural and synthetic homopolymers, such as polyols (i.e. poly-OH), polyamines (i.e. poly-NH₂) and polycarboxylic acids (i.e. poly-COOH), and further heteropolymers i.e. polymers comprising one or more different coupling groups e.g. a hydroxyl group and amine groups. Examples of suitable polymeric
30 molecules include polymeric molecules selected from among polyalkylene oxides (PAO), such as polyalkylene glycols (PAG), including polyethylene glycols (PEG),

- 59 -

methoxypolyethylene glycols (mPEG) and polypropylene glycols, PEG-glycidyl ethers (Epox-PEG), PEG-oxycarbonylimidazole (CDI-PEG), branched polyethylene glycols (PEGs), polyvinyl alcohol (PVA), polycarboxylates, polyvinylpyrrolidone, poly-D,L-amino acids, polyethylene-co-maleic acid anhydride, polystyrene-co-maleic acid anhydride, dextrans including carboxymethyl-dextrans, heparin, homologous albumin, celluloses, including methylcellulose, carboxymethylcellulose, ethylcellulose, hydroxyethylcellulose, carboxyethylcellulose and hydroxypropylcellulose, hydrolysates of chitosan, starches such as hydroxyethyl-starches and hydroxypropyl-starches, glycogen, agaroses and derivatives thereof, guar gum, pullulan, inulin, xanthan gum, carrageenan, pectin, alginic acid hydrolysates and bio-polymers.

Typically, the polymers are polyalkylene oxides (PAO), such as polyethylene oxides, such as PEG, typically mPEG, which, in comparison to polysaccharides such as dextran, pullulan and the like, have few reactive groups capable of cross-linking.

Typically, the polymers are non-toxic polymeric molecules such as (methoxy)polyethylene glycol (mPEG) which can be covalently conjugated to the esPH20 polypeptides and other C-terminally truncated PH20 polypeptides (*e.g.*, to attachment groups on the protein surface) using a relatively simple chemistry.

Suitable polymeric molecules for attachment to the esPH20 polypeptides and other C-terminally truncated PH20 polypeptides include, but are not limited to, polyethylene glycol (PEG) and PEG derivatives such as methoxy-polyethylene glycols (mPEG), PEG-glycidyl ethers (Epox-PEG), PEG-oxycarbonylimidazole (CDI-PEG), branched PEGs, and polyethylene oxide (PEO) (see *e.g.* Roberts et al., *Advanced Drug Delivery Review* 2002, 54: 459-476; Harris and Zalipsky (eds.) "Poly(ethylene glycol), Chemistry and Biological Applications" ACS Symposium Series 680, 1997; Mehvar et al., *J. Pharm. Pharmaceut. Sci.*, 3(1):125-136, 2000; Harris and Chess (2003) *Nat Rev Drug Discov.* 2(3):214-21; and Tsubery, *J Biol. Chem* 279(37):38118-24, 2004). The polymeric molecule can be of a molecular weight typically ranging from about 3 kDa to about 60 kDa. In some embodiments the polymeric molecule that is conjugated to a PH20 polypeptide provided herein has

- 60 -

a molecular weight of 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60 or more than 60 kDa.

Various methods of modifying polypeptides by covalently attaching (conjugating) a PEG or PEG derivative (i.e. "PEGylation") are known in the art (see *e.g.*, U.S. 2006/0104968; U.S. 5,672,662; U.S. 6,737,505; and U.S. 2004/0235734). Techniques for PEGylation include, but are not limited to, specialized linkers and coupling chemistries (see *e.g.*, Harris, *Adv. Drug Deliv. Rev.* 54:459-476, 2002), attachment of multiple PEG moieties to a single conjugation site (such as via use of branched PEGs; see *e.g.*, Veronese et al., *Bioorg. Med. Chem. Lett.* 12:177-180, 2002), site-specific PEGylation and/or mono-PEGylation (see *e.g.*, Chapman et al., *Nature Biotech.* 17:780-783, 1999), and site-directed enzymatic PEGylation (see *e.g.*, Sato, *Adv. Drug Deliv. Rev.*, 54:487-504, 2002) (see, also, for example, Lu and Felix (1994) *Int. J. Peptide Protein Res.* 43:127-138; Lu and Felix (1993) *Peptide Res.* 6:142-6, 1993; Felix et al. (1995) *Int. J. Peptide Res.* 46:253-64; Benhar et al. (1994) *J. Biol. Chem.* 269:13398-404; Brumeanu et al. (1995) *J Immunol.* 154:3088-95; see also, Caliceti et al. (2003) *Adv. Drug Deliv. Rev.* 55(10):1261-77 and Molineux (2003) *Pharmacotherapy* 23 (8 Pt 2):3S-8S). Methods and techniques described in the art can produce proteins having 1, 2, 3, 4, 5, 6, 7, 8, 9, 10 or more than 10 PEG or PEG derivatives attached to a single protein molecule (see *e.g.*, U.S. 2006/0104968).

Numerous reagents for PEGylation have been described in the art. Such reagents include, but are not limited to, N-hydroxysuccinimidyl (NHS) activated PEG, succinimidyl mPEG, mPEG2-N-hydroxysuccinimide, mPEG succinimidyl alpha-methylbutanoate, mPEG succinimidyl propionate, mPEG succinimidyl butanoate, mPEG carboxymethyl 3-hydroxybutanoic acid succinimidyl ester, homobifunctional PEG-succinimidyl propionate, homobifunctional PEG propionaldehyde, homobifunctional PEG butyraldehyde, PEG maleimide, PEG hydrazide, p-nitrophenyl-carbonate PEG, mPEG-benzotriazole carbonate, propionaldehyde PEG, mPEG butyraldehyde, branched mPEG2 butyraldehyde, mPEG acetyl, mPEG piperidone, mPEG methylketone, mPEG "linkerless" maleimide, mPEG vinyl sulfone, mPEG thiol, mPEG orthopyridylthioester, mPEG orthopyridyl disulfide, Fmoc-PEG-NHS, Boc-PEG-NHS, vinylsulfone PEG-NHS,

- 61 -

acrylate PEG-NHS, fluorescein PEG-NHS, and biotin PEG-NHS (see *e.g.*, Monfardini et al., *Bioconjugate Chem.* 6:62-69, 1995; Veronese et al., *J. Bioactive Compatible Polymers* 12:197-207, 1997; U.S. 5,672,662; U.S. 5,932,462; U.S. 6,495,659; U.S. 6,737,505; U.S. 4,002,531; U.S. 4,179,337; U.S. 5,122,614; U.S. 5,183,550; U.S. 5,324, 844; U.S. 5,446,090; U.S. 5,612,460; U.S. 5,643,575; U.S. 5,766,581; U.S. 5,795, 569; U.S. 5,808,096; U.S. 5,900,461; U.S. 5,919,455; U.S. 5,985,263; U.S. 5,990, 237; U.S. 6,113,906; U.S. 6,214,966; U.S. 6,258,351; U.S. 6,340,742; U.S. 6,413,507; U.S. 6,420,339; U.S. 6,437,025; U.S. 6,448,369; U.S. 6,461,802; U.S. 6,828,401; U.S. 6,858,736; U.S. 2001/0021763; U.S. 2001/0044526; U.S. 2001/0046481; U.S. 2002/0052430; U.S. 2002/0072573; U.S. 2002/0156047; U.S. 2003/0114647; U.S. 2003/0143596; U.S. 2003/0158333; U.S. 2003/0220447; U.S. 2004/0013637; US 2004/0235734; U.S. 2005/000360; U.S. 2005/0114037; U.S. 2005/0171328; U.S. 2005/0209416; EP 01064951; EP 0822199; WO 00176640; WO 0002017; WO 0249673; WO 9428024; and WO 0187925).

Other modifications

The esPH20 polypeptides and other C-terminally truncated PH20 polypeptides provided herein also include fusions and conjugates thereof.

E. Methods of Producing Nucleic Acids Encoding Extended Soluble PH20 and other Soluble PH20 Hyaluronidases, and Polypeptides Thereof

Polypeptides of extended soluble PH20, C-terminal truncated PH20 hyaluronidases, and partially glycosylated PH20 hyaluronidases set forth herein, and nucleic acid molecules encoding such polypeptides, can be obtained by methods well known in the art for recombinant protein expression and protein purification. For example, the DNA can be obtained from cloned DNA (*e.g.* from a DNA library), by chemical synthesis, by cDNA cloning, or by the cloning of genomic DNA or fragments thereof, purified from the desired cell. When the polypeptides are produced by recombinant means, any method known to those of skill in the art for identification of nucleic acids that encode desired genes can be used. Any method available in the art can be used to obtain a full length (*i.e.* encompassing the entire coding region) cDNA or genomic DNA encoding a desired PH20 enzyme, such as from a cell or tissue source. Modified or variant, including truncated forms such as

- 62 -

provided herein, can be engineered from a wildtype polypeptide using standard recombinant DNA methods.

Polypeptides can be cloned or isolated using any available methods known in the art for cloning and isolating nucleic acid molecules. Such methods include PCR
5 amplification of nucleic acids and screening of libraries, including nucleic acid hybridization screening, antibody-based screening and activity-based screening.

Methods for amplification of nucleic acids can be used to isolate nucleic acid molecules encoding a desired polypeptide, including for example, polymerase chain reaction (PCR) methods. PCR can be carried out using any known methods or
10 procedures in the art. Exemplary of such methods include use of a Perkin-Elmer Cetus thermal cycler and Taq polymerase (Gene Amp). A nucleic acid containing material can be used as a starting material from which a desired polypeptide-encoding nucleic acid molecule can be isolated. For example, DNA and mRNA preparations, cell extracts, tissue extracts from an appropriate source (e.g. testis, prostate, breast),
15 fluid samples (e.g. blood, serum, saliva), samples from healthy and/or diseased subjects can be used in amplification methods. The source can be from any eukaryotic species including, but not limited to, vertebrate, mammalian, human, porcine, bovine, feline, avian, equine, canine, and other primate sources. Nucleic acid libraries also can be used as a source of starting material. Primers can be designed to
20 amplify a desired polypeptide. For example, primers can be designed based on expressed sequences from which a desired polypeptide is generated. Primers can be designed based on back-translation of a polypeptide amino acid sequence. If desired, degenerate primers can be used for amplification. Oligonucleotide primers that hybridize to sequences at the 3' and 5' termini of the desired sequence can be used as
25 primers to amplify by PCR sequences from a nucleic acid sample. Primers can be used to amplify the entire full-length PH20, or a truncated sequence thereof, such as a nucleic acid encoding any of the soluble PH20 polypeptides provided herein. Nucleic acid molecules generated by amplification can be sequenced and confirmed to encode a desired polypeptide.

30 Additional nucleotide sequences can be joined to a polypeptide-encoding nucleic acid molecule, including linker sequences containing restriction endonuclease

- 63 -

sites for the purpose of cloning the synthetic gene into a vector, for example, a protein expression vector or a vector designed for the amplification of the core protein coding DNA sequences. Furthermore, additional nucleotide sequences specifying functional DNA elements can be operatively linked to a polypeptide-encoding nucleic acid molecule. Examples of such sequences include, but are not limited to, promoter sequences designed to facilitate intracellular protein expression, and secretion sequences, for example heterologous signal sequences, designed to facilitate protein secretion. Such sequences are known to those of skill in the art. For example, exemplary heterologous signal sequences include, but are not limited to, human and mouse kappa IgG heterologous signal sequences set forth in SEQ ID NOS:144 and 145, respectively. Additional nucleotide residues sequences such as sequences of bases specifying protein binding regions also can be linked to enzyme-encoding nucleic acid molecules. Such regions include, but are not limited to, sequences of residues that facilitate or encode proteins that facilitate uptake of an enzyme into specific target cells, or otherwise alter pharmacokinetics of a product of a synthetic gene.

In addition, tags or other moieties can be added, for example, to aid in detection or affinity purification of the polypeptide. For example, additional nucleotide residues sequences such as sequences of bases specifying an epitope tag or other detectable marker also can be linked to enzyme-encoding nucleic acid molecules. Exemplary of such sequences include nucleic acid sequences encoding a His tag (e.g., 6xHis, HHHHHH; SEQ ID NO:142) or Flag Tag (DYKDDDDK; SEQ ID NO:143).

The identified and isolated nucleic acids can then be inserted into an appropriate cloning vector. A large number of vector-host systems known in the art can be used. Possible vectors include, but are not limited to, plasmids or modified viruses, but the vector system must be compatible with the host cell used. Such vectors include, but are not limited to, bacteriophage such as lambda derivatives, or plasmids such as pCMV4, pBR322 or pUC plasmid derivatives or the Bluescript vector (Stratagene, La Jolla, CA). Other expression vectors include the HZ24 expression vector exemplified herein (set forth in SEQ ID NO:140). The insertion into a cloning vector can, for example, be accomplished by ligating the DNA

- 64 -

fragment into a cloning vector which has complementary cohesive termini. If the complementary restriction sites used to fragment the DNA are not present in the cloning vector, the ends of the DNA molecules can be enzymatically modified. Alternatively, any site desired can be produced by ligating nucleotide sequences (linkers) onto the DNA termini; these ligated linkers can include specific chemically synthesized oligonucleotides encoding restriction endonuclease recognition sequences. In an alternative method, the cleaved vector and protein gene can be modified by homopolymeric tailing. Insertion can be effected using TOPO cloning vectors (INVITROGEN, Carlsbad, CA).

Recombinant molecules can be introduced into host cells via, for example, transformation, transfection, infection, electroporation and sonoporation, so that many copies of the gene sequence are generated. In specific embodiments, transformation of host cells with recombinant DNA molecules that incorporate the isolated protein gene, cDNA, or synthesized DNA sequence enables generation of multiple copies of the gene. Thus, the gene can be obtained in large quantities by growing transformants, isolating the recombinant DNA molecules from the transformants and, when necessary, retrieving the inserted gene from the isolated recombinant DNA.

In addition to recombinant production, soluble PH20, including any esPH20 provided herein, can be produced by direct peptide synthesis using solid-phase techniques (see e.g., Stewart et al. (1969) *Solid-Phase Peptide Synthesis*, WH Freeman Co., San Francisco; Merrifield J (1963) *J Am Chem Soc.*, 85:2149-2154). *In vitro* protein synthesis can be performed using manual techniques or by automation. Automated synthesis can be achieved, for example, using Applied Biosystems 431A Peptide Synthesizer (Perkin Elmer, Foster City CA) in accordance with the instructions provided by the manufacturer. Various fragments of a polypeptide can be chemically synthesized separately and combined using chemical methods.

1. Vectors and Cells

For recombinant expression of one or more of the desired proteins, such as any described herein, the nucleic acid containing all or a portion of the nucleotide sequence encoding the protein can be inserted into an appropriate expression vector, *i.e.*, a vector that contains the necessary elements for the transcription and translation

- 65 -

of the inserted protein coding sequence. The necessary transcriptional and translational signals also can be supplied by the native promoter for PH20 genes, and/or their flanking regions.

Also provided are vectors that contain a nucleic acid encoding the enzyme.

- 5 Cells containing the vectors also are provided. The cells include eukaryotic and prokaryotic cells, and the vectors are any suitable for use therein.

- Prokaryotic and eukaryotic cells, including endothelial cells, containing the vectors are provided. Such cells include bacterial cells, yeast cells, fungal cells, Archea, plant cells, insect cells and animal cells. The cells are used to produce a
- 10 protein thereof by growing the above-described cells under conditions whereby the encoded protein is expressed by the cell, and recovering the expressed protein. For purposes herein, for example, soluble PH20 polypeptides, including extended soluble PH20 polypeptides, can be secreted into the medium.

- A host cells strain can be chosen for its ability to modulate the expression of
- 15 the inserted sequences or to process the expressed protein in the desired fashion. Such modifications of the polypeptide include, but are not limited to, acetylation, carboxylation, glycosylation, phosphorylation, lipidation and acylation. Post-translational processing can impact the folding and/or function of the polypeptide. Different host cells, such as, but not limited to, CHO (DG44, DXB11, CHO-K1),
- 20 HeLa, MCDK, 293 and WI38 have specific cellular machinery and characteristic mechanisms for such post-translational activities and can be chosen to ensure the correct modification and processing of the introduced protein. Generally, the choice of cell is one that is capable of introducing N-linked glycosylation into the expressed polypeptide. Hence, eukaryotic cells containing the vectors are provided. Exemplary
- 25 of eukaryotic cells are mammalian Chinese Hamster Ovary (CHO) cells. For example, CHO cells deficient in dihydrofolate reductase (e.g. DG44 cells) are used to produce polypeptides provided herein. Note that bacterial expression of an extended soluble PH20 or C-terminally truncated PH20 provided herein will not result in a catalytically active polypeptide, but when combined with proper glycosylation
- 30 machinery, the PH20 can be artificially glycosylated.

- 66 -

Provided are vectors that contain a sequence of nucleotides that encodes the hyaluronidase polypeptide, including extended soluble PH20 polypeptides and other C-terminal truncated PH20 polypeptides, coupled to the native or heterologous signal sequence, as well as multiple copies thereof. The vectors can be selected for
5 expression of the enzyme protein in the cell or such that the enzyme protein is expressed as a secreted protein.

A variety of host-vector systems can be used to express the protein coding sequence. These include but are not limited to mammalian cell systems infected with virus (*e.g.* vaccinia virus, adenovirus and other viruses); insect cell systems infected
10 with virus (*e.g.* baculovirus); microorganisms such as yeast containing yeast vectors; or bacteria transformed with bacteriophage, DNA, plasmid DNA, or cosmid DNA. The expression elements of vectors vary in their strengths and specificities. Depending on the host-vector system used, any one of a number of suitable transcription and translation elements can be used.

15 Any methods known to those of skill in the art for the insertion of DNA fragments into a vector can be used to construct expression vectors containing a chimeric gene containing appropriate transcriptional/translational control signals and protein coding sequences. These methods can include *in vitro* recombinant DNA and synthetic techniques and *in vivo* recombinants (genetic recombination). Expression of
20 nucleic acid sequences encoding protein, or domains, derivatives, fragments or homologs thereof, can be regulated by a second nucleic acid sequence so that the genes or fragments thereof are expressed in a host transformed with the recombinant DNA molecule(s). For example, expression of the proteins can be controlled by any promoter/enhancer known in the art. In a specific embodiment, the promoter is not
25 native to the genes for a desired protein. Promoters which can be used include but are not limited to the SV40 early promoter (Bernoist and Chambon, *Nature* 290:304-310 (1981)), the promoter contained in the 3' long terminal repeat of Rous sarcoma virus (Yamamoto *et al.* *Cell* 22:787-797 (1980)), the herpes thymidine kinase promoter (Wagner *et al.*, *Proc. Natl. Acad. Sci. USA* 78:1441-1445 (1981)), the regulatory
30 sequences of the metallothionein gene (Brinster *et al.*, *Nature* 296:39-42 (1982)); prokaryotic expression vectors such as the b-lactamase promoter (Jay *et al.*, (1981)

- 67 -

Proc. Natl. Acad. Sci. USA 78:5543) or the *tac* promoter (DeBoer *et al.*, *Proc. Natl. Acad. Sci. USA* 80:21-25 (1983)); see also "Useful Proteins from Recombinant Bacteria": in *Scientific American* 242:79-94 (1980)); plant expression vectors containing the nopaline synthase promoter (Herrera-Estrella *et al.*, *Nature* 303:209-213 (1984)) or the cauliflower mosaic virus 35S RNA promoter (Gardner *et al.*, *Nucleic Acids Res.* 9:2871 (1981)), and the promoter of the photosynthetic enzyme ribulose biphosphate carboxylase (Herrera-Estrella *et al.*, *Nature* 310:115-120 (1984)); promoter elements from yeast and other fungi such as the Gal4 promoter, the alcohol dehydrogenase promoter, the phosphoglycerol kinase promoter, the alkaline phosphatase promoter, and the following animal transcriptional control regions that exhibit tissue specificity and have been used in transgenic animals: elastase I gene control region which is active in pancreatic acinar cells (Swift *et al.*, *Cell* 38:639-646 (1984); Ornitz *et al.*, *Cold Spring Harbor Symp. Quant. Biol.* 50:399-409 (1986); MacDonald, *Hepatology* 7:425-515 (1987)); insulin gene control region which is active in pancreatic beta cells (Hanahan *et al.*, *Nature* 315:115-122 (1985)), immunoglobulin gene control region which is active in lymphoid cells (Grosschedl *et al.*, *Cell* 38:647-658 (1984); Adams *et al.*, *Nature* 318:533-538 (1985); Alexander *et al.*, *Mol. Cell Biol.* 7:1436-1444 (1987)), mouse mammary tumor virus control region which is active in testicular, breast, lymphoid and mast cells (Leder *et al.*, *Cell* 45:485-495 (1986)), albumin gene control region which is active in liver (Pinckert *et al.*, *Genes and Devel.* 1:268-276 (1987)), alpha-fetoprotein gene control region which is active in liver (Krumlauf *et al.*, *Mol. Cell Biol.* 5:1639-1648 (1985); Hammer *et al.*, *Science* 235:53-58 (1987)), alpha-1 antitrypsin gene control region which is active in liver (Kelsey *et al.*, *Genes and Devel.* 1:161-171 (1987)), beta globin gene control region which is active in myeloid cells (Magram *et al.*, *Nature* 315:338-340 (1985); Kollias *et al.*, *Cell* 46:89-94 (1986)), myelin basic protein gene control region which is active in oligodendrocyte cells of the brain (Readhead *et al.*, *Cell* 48:703-712 (1987)), myosin light chain-2 gene control region which is active in skeletal muscle (Shani, *Nature* 314:283-286 (1985)), and gonadotrophic releasing hormone gene control region which is active in gonadotrophs of the hypothalamus (Mason *et al.*, *Science* 234:1372-1378 (1986)).

- 68 -

In a specific embodiment, a vector is used that contains a promoter operably linked to nucleic acids encoding a PH20 protein, or a domain, fragment, derivative or homolog, thereof, one or more origins of replication, and optionally, one or more selectable markers (*e.g.*, an antibiotic resistance gene). Depending on the expression system, specific initiation signals also are required for efficient translation of a PH20 sequence. These signals include the ATG initiation codon and adjacent sequences. In cases where the initiation codon and upstream sequences of PH20 or soluble forms thereof are inserted into the appropriate expression vector, no additional translational control signals are needed. In cases where only coding sequence, or a portion thereof, is inserted, exogenous transcriptional control signals including the ATG initiation codon must be provided. Furthermore, the initiation codon must be in the correct reading frame to ensure transcription of the entire insert. Exogenous transcriptional elements and initiation codons can be of various origins, both natural and synthetic. The efficiency of expression can be enhanced by the inclusion of enhancers appropriate to the cell system in use (Scharf et al. (1994) *Results Probl Cell Differ* 20:125-62; Bittner et al. (1987) *Methods in Enzymol.*, 153:516-544).

Exemplary plasmid vectors for transformation of *E. coli* cells, include, for example, the pQE expression vectors (available from Qiagen, Valencia, CA; see also literature published by Qiagen describing the system). pQE vectors have a phage T5 promoter (recognized by *E. coli* RNA polymerase) and a double lac operator repression module to provide tightly regulated, high-level expression of recombinant proteins in *E. coli*, a synthetic ribosomal binding site (RBS II) for efficient translation, a 6XHis tag coding sequence, t_0 and T1 transcriptional terminators, ColE1 origin of replication, and a beta-lactamase gene for conferring ampicillin resistance. The pQE vectors enable placement of a 6xHis tag at either the N- or C-terminus of the recombinant protein. Such plasmids include pQE 32, pQE 30, and pQE 31 which provide multiple cloning sites for all three reading frames and provide for the expression of N-terminally 6xHis-tagged proteins. Other exemplary plasmid vectors for transformation of *E. coli* cells, include, for example, the pET expression vectors (see, U.S. patent 4,952,496; available from NOVAGEN, Madison, WI; see, also literature published by Novagen describing the system). Such plasmids include pET

- 69 -

11a, which contains the T7lac promoter, T7 terminator, the inducible *E. coli* lac operator, and the lac repressor gene; pET 12a-c, which contains the T7 promoter, T7 terminator, and the *E. coli* ompT secretion signal; and pET 15b and pET19b (NOVAGEN, Madison, WI), which contain a His-TagTM leader sequence for use in
5 purification with a His column and a thrombin cleavage site that permits cleavage following purification over the column, the T7-lac promoter region and the T7 terminator.

Exemplary of a vector for mammalian cell expression is the HZ24 expression vector. The HZ24 expression vector was derived from the pCI vector backbone
10 (Promega). It contains DNA encoding the Beta-lactamase resistance gene (AmpR), an F1 origin of replication, a Cytomegalovirus immediate-early enhancer/promoter region (CMV), and an SV40 late polyadenylation signal (SV40). The expression vector also has an internal ribosome entry site (IRES) from the ECMV virus (Clontech) and the mouse dihydrofolate reductase (DHFR) gene. Cells transfected
15 with such a vector can be cultured in chemically defined medium in the absence of hypoxanthine and thymidine, followed by further gene amplification with increasing concentrations of methotrexate. Such methods are described herein in Examples 13 and 15.

2. Expression

20 PH20 polypeptides, including esPH20 polypeptides and C-terminally truncated PH20 polypeptides provided herein, can be produced by any method known to those of skill in the art including in vivo and in vitro methods. Desired proteins can be expressed in any organism suitable to produce the required amounts and forms of the proteins, such as for example, needed for administration and treatment.
25 Expression hosts include prokaryotic and eukaryotic organisms such as *E. coli*, yeast, plants, insect cells, mammalian cells, including human cell lines and transgenic animals. Expression hosts can differ in their protein production levels as well as the types of post-translational modification that are present on the expressed proteins. The choice of expression host can be made based on these and other factors, such as
30 regulatory and safety considerations, production costs and the need and methods for purification.

- 70 -

Many expression vectors are available and known to those of skill in the art and can be used for expression of proteins. The choice of expression vector will be influenced by the choice of host expression system. In general, expression vectors can include transcriptional promoters and optionally enhancers, translational signals, and transcriptional and translational termination signals. Expression vectors that are used for stable transformation typically have a selectable marker which allows selection and maintenance of the transformed cells. In some cases, an origin of replication can be used to amplify the copy number of the vector.

Soluble hyaluronidase polypeptides, including esPH20, and other C-terminally truncated PH20 polypeptides, also can be utilized or expressed as protein fusions. For example, an enzyme fusion can be generated to add additional functionality to an enzyme. Examples of enzyme fusion proteins include, but are not limited to, fusions of a signal sequence, a tag such as for localization, *e.g.* a his₆ tag or a myc tag, or a tag for purification, for example, a GST fusion, a sequence for directing protein secretion and/or membrane association and other sequences used to increase half-life such as an Fc fusion.

For long-term, high-yield production of recombinant proteins, stable expression is desired. For example, cell lines that stably express a soluble PH20, such as an esPH20, or another C-terminally truncated PH20 polypeptide, can be transformed using expression vectors that contain viral origins of replication or endogenous expression elements and a selectable marker gene. Following the introduction of the vector, cells can be allowed to grow for 1-2 days in an enriched media before they are switched to selective media. The purpose of the selectable marker is to confer resistance to selection, and its presence allows growth and recovery of cells that successfully express the introduced sequences. Resistant cells of stably transformed cells can be proliferated using tissue culture techniques appropriate to the cell types.

Any number of selection systems can be used to recover transformed cell lines. These include, but are not limited to, the herpes simplex virus thymidine kinase (Wigler M et al. (1977) *Cell*, 11:223-32) and adenine phosphoribosyltransferase (Lowy I et al. (1980) *Cell*, 22:817-23) genes, which can be employed in TK- or

- 71 -

APRT- cells, respectively. Also, antimetabolite, antibiotic or herbicide resistance can be used as the basis for selection. For example, DHFR, which confers resistance to methotrexate (Wigler M et al. (1980) *Proc. Natl. Acad. Sci.* 77:3567-70); npt, which confers resistance to the aminoglycosides neomycin and G-418 (Colbere-Garapin F et al. (1981) *J. Mol. Biol.*, 150:1-14); and als or pat, which confer resistance to chlorsulfuron and phosphinotricin acetyltransferase, respectively, can be used. Additional selectable genes have been described, for example, trpB, which allows cells to utilize indole in place of typtophan or hisD, which allows cells to utilize histinol in place of histidine (Hartman SC and RC Mulligan (1988) *Proc. Natl. Acad. Sci.* 85:8047-51). Visible markers, such as but not limited to, anthocyanins, beta glucuronidase and its substrate, GUS, and luciferase and its substrate luciferin, also can be used to identify transformants and also to quantify the amount of transient or stable protein expression attributable to a particular vector system (Rhodes CA et al. (1995) *Methods Mol. Biol.* 55:121-131).

15 The presence and expression of soluble PH20 polypeptides, including esPH20, and other C-terminal truncated PH20 polypetpides, can be monitored. For example, detection of a functional polypeptide can be determined by testing the conditioned media for hyaluronidase enzyme activity under appropriate conditions. Section G below provides exemplary assays to assess the solubility and activity of expressed proteins.

a. Prokaryotic Cells

Prokaryotes, especially *E. coli*, provide a system for producing large amounts of proteins. Transformation of *E. coli* is simple and rapid technique well known to those of skill in the art. Expression vectors for *E.coli* can contain inducible promoters, such promoters are useful for inducing high levels of protein expression and for expressing proteins that exhibit some toxicity to the host cells. Examples of inducible promoters include the lac promoter, the trp promoter, the hybrid tac promoter, the T7 and SP6 RNA promoters and the temperature regulated λ PL promoter.

30 Proteins, such as any provided herein, can be expressed in the cytoplasmic environment of *E. coli*. The cytoplasm is a reducing environment and for some

- 72 -

molecules, this can result in the formation of insoluble inclusion bodies. Reducing agents such as dithiothreitol and β -mercaptoethanol and denaturants, such as guanidine-HCl and urea can be used to resolubilize the proteins. An alternative approach is the expression of proteins in the periplasmic space of bacteria which provides an oxidizing environment and chaperonin-like and disulfide isomerases and can lead to the production of soluble protein. Typically, a leader sequence is fused to the protein to be expressed which directs the protein to the periplasm. The leader is then removed by signal peptidases inside the periplasm. Examples of periplasmic-targeting leader sequences include the pelB leader from the pectate lyase gene and the leader derived from the alkaline phosphatase gene. In some cases, periplasmic expression allows leakage of the expressed protein into the culture medium. The secretion of proteins allows quick and simple purification from the culture supernatant. Proteins that are not secreted can be obtained from the periplasm by osmotic lysis. Similar to cytoplasmic expression, in some cases proteins can become insoluble and denaturants and reducing agents can be used to facilitate solubilization and refolding. Temperature of induction and growth also can influence expression levels and solubility, typically temperatures between 25 °C and 37 °C are used. Typically, bacteria produce aglycosylated proteins. Thus, if proteins require glycosylation for function, glycosylation can be added *in vitro* after purification from host cells.

b. Yeast Cells

Yeasts such as *Saccharomyces cerevisiae*, *Schizosaccharomyces pombe*, *Yarrowia lipolytica*, *Kluyveromyces lactis* and *Pichia pastoris* are well known yeast expression hosts that can be used for production of proteins, such as any described herein. Yeast can be transformed with episomal replicating vectors or by stable chromosomal integration by homologous recombination. Typically, inducible promoters are used to regulate gene expression. Examples of such promoters include GAL1, GAL7 and GAL5 and metallothionein promoters, such as CUP1, AOX1 or other *Pichia* or other yeast promoter. Expression vectors often include a selectable marker such as LEU2, TRP1, HIS3 and URA3 for selection and maintenance of the transformed DNA. Proteins expressed in yeast are often soluble. Co-expression with

- 73 -

chaperonins such as Bip and protein disulfide isomerase can improve expression levels and solubility. Additionally, proteins expressed in yeast can be directed for secretion using secretion signal peptide fusions such as the yeast mating type alpha-factor secretion signal from *Saccharomyces cerevisiae* and fusions with yeast cell surface proteins such as the Aga2p mating adhesion receptor or the *Arxula adenivorans* glucoamylase. A protease cleavage site such as for the Kex-2 protease, can be engineered to remove the fused sequences from the expressed polypeptides as they exit the secretion pathway. Yeast also is capable of glycosylation at Asn-X-Ser/Thr motifs.

10 **c. Insect Cells**

Insect cells, particularly using baculovirus expression, are useful for expressing polypeptides such as hyaluronidase polypeptides. Insect cells express high levels of protein and are capable of most of the post-translational modifications used by higher eukaryotes. Baculovirus have a restrictive host range which improves the safety and reduces regulatory concerns of eukaryotic expression. Typical expression vectors use a promoter for high level expression such as the polyhedrin promoter of baculovirus. Commonly used baculovirus systems include the baculoviruses such as *Autographa californica* nuclear polyhedrosis virus (AcNPV), and the *bombyx mori* nuclear polyhedrosis virus (BmNPV) and an insect cell line such as Sf9 derived from *Spodoptera frugiperda*, *Pseudaletia unipuncta* (A7S) and *Danaus plexippus* (DpN1). For high-level expression, the nucleotide sequence of the molecule to be expressed is fused immediately downstream of the polyhedrin initiation codon of the virus. Mammalian secretion signals are accurately processed in insect cells and can be used to secrete the expressed protein into the culture medium. In addition, the cell lines *Pseudaletia unipuncta* (A7S) and *Danaus plexippus* (DpN1) produce proteins with glycosylation patterns similar to mammalian cell systems. Exemplary insect cells are those that have been altered to reduce immunogenicity, including those with “mammalianized” baculovirus expression vectors and those lacking the enzyme FT3.

30 An alternative expression system in insect cells is the use of stably transformed cells. Cell lines such as the Schneider 2 (S2) and Kc cells (*Drosophila melanogaster*) and C7 cells (*Aedes albopictus*) can be used for expression. The

- 74 -

Drosophila metallothionein promoter can be used to induce high levels of expression in the presence of heavy metal induction with cadmium or copper. Expression vectors are typically maintained by the use of selectable markers such as neomycin and hygromycin.

5 **d. Mammalian Cells**

Mammalian expression systems can be used to express proteins including soluble hyaluronidase polypeptides. Expression constructs can be transferred to mammalian cells by viral infection such as adenovirus or by direct DNA transfer such as liposomes, calcium phosphate, DEAE-dextran and by physical means such as
10 electroporation and microinjection. Expression vectors for mammalian cells typically include an mRNA cap site, a TATA box, a translational initiation sequence (Kozak consensus sequence) and polyadenylation elements. IRES elements also can be added to permit bicistronic expression with another gene, such as a selectable marker. Such vectors often include transcriptional promoter-enhancers for high-level expression, for
15 example the SV40 promoter-enhancer, the human cytomegalovirus (CMV) promoter and the long terminal repeat of Rous sarcoma virus (RSV). These promoter-enhancers are active in many cell types. Tissue and cell-type promoters and enhancer regions also can be used for expression. Exemplary promoter/enhancer regions include, but are not limited to, those from genes such as elastase I, insulin,
20 immunoglobulin, mouse mammary tumor virus, albumin, alpha fetoprotein, alpha 1 antitrypsin, beta globin, myelin basic protein, myosin light chain 2, and gonadotropic releasing hormone gene control. Selectable markers can be used to select for and maintain cells with the expression construct. Examples of selectable marker genes include, but are not limited to, hygromycin B phosphotransferase, adenosine
25 deaminase, xanthine-guanine phosphoribosyl transferase, aminoglycoside phosphotransferase, dihydrofolate reductase (DHFR) and thymidine kinase. For example, expression can be performed in the presence of methotrexate to select for only those cells expressing the DHFR gene. Fusion with cell surface signaling molecules such as TCR- ζ and Fc ϵ RI- γ can direct expression of the proteins in an
30 active state on the cell surface.

- 75 -

Many cell lines are available for mammalian expression including mouse, rat human, monkey, chicken and hamster cells. Exemplary cell lines include but are not limited to CHO, Balb/3T3, HeLa, MT2, mouse NS0 (nonsecreting) and other myeloma cell lines, hybridoma and heterohybridoma cell lines, lymphocytes, fibroblasts, Sp2/0, COS, NIH3T3, HEK293, 293S, 2B8, and HKB cells. Cell lines also are available adapted to serum-free media which facilitates purification of secreted proteins from the cell culture media. Examples include CHO-S cells (Invitrogen, Carlsbad, CA, cat # 11619-012) and the serum free EBNA-1 cell line (Pham *et al.*, (2003) *Biotechnol. Bioeng.* 84:332-42.). Cell lines also are available that are adapted to grow in special mediums optimized for maximal expression. For example, DG44 CHO cells are adapted to grow in suspension culture in a chemically defined, animal product-free medium.

e. Plants

Transgenic plant cells and plants can be used to express proteins such as any described herein. Expression constructs are typically transferred to plants using direct DNA transfer such as microprojectile bombardment and PEG-mediated transfer into protoplasts, and with agrobacterium-mediated transformation. Expression vectors can include promoter and enhancer sequences, transcriptional termination elements and translational control elements. Expression vectors and transformation techniques are usually divided between dicot hosts, such as *Arabidopsis* and tobacco, and monocot hosts, such as corn and rice. Examples of plant promoters used for expression include the cauliflower mosaic virus promoter, the nopaline synthase promoter, the ribose biphosphate carboxylase promoter and the ubiquitin and UBQ3 promoters. Selectable markers such as hygromycin, phosphomannose isomerase and neomycin phosphotransferase are often used to facilitate selection and maintenance of transformed cells. Transformed plant cells can be maintained in culture as cells, aggregates (callus tissue) or regenerated into whole plants. Transgenic plant cells also can include algae engineered to produce hyaluronidase polypeptides. Because plants have different glycosylation patterns than mammalian cells, this can influence the choice of protein produced in these hosts.

3. Purification Techniques

- 76 -

Host cells transformed with a nucleic acid sequence encoding a soluble PH20, including esPH20, and other C-terminal truncated PH20 polypeptides, can be cultured under conditions suitable for the expression and recovery of the encoded protein from cell culture. The protein produced by a recombinant cell is generally secreted, but
5 may be contained intracellularly depending on the sequence and/or the vector used. As will be understood by those of skill in the art, expression vectors containing nucleic acid encoding PH20 can be designed with signal sequences that facilitate direct secretion of PH20 through prokaryotic or eukaryotic cell membrane.

Thus, method for purification of polypeptides from host cells will depend on
10 the chosen host cells and expression systems. For secreted molecules, proteins are generally purified from the culture media after removing the cells. For intracellular expression, cells can be lysed and the proteins purified from the extract. When transgenic organisms such as transgenic plants and animals are used for expression, tissues or organs can be used as starting material to make a lysed cell extract.
15 Additionally, transgenic animal production can include the production of polypeptides in milk or eggs, which can be collected, and if necessary, the proteins can be extracted and further purified using standard methods in the art.

Proteins, such as soluble PH20 polypeptides, including esPH20 polypeptides, or other C-terminal truncated PH20 polypeptides, can be purified using standard
20 protein purification techniques known in the art including but not limited to, SDS-PAGE, size fractionation and size exclusion chromatography, ammonium sulfate precipitation and ionic exchange chromatography, such as anion exchange. Affinity purification techniques also can be utilized to improve the efficiency and purity of the preparations. For example, antibodies, receptors and other molecules that bind PH20
25 hyaluronidase enzymes can be used in affinity purification. For example, soluble PH20 can be purified from conditioned media.

Expression constructs also can be engineered to add an affinity tag to a protein such as a myc epitope, GST fusion or His₆ and affinity purified with myc antibody, glutathione resin and Ni-resin, respectively. Such tags can be joined to the nucleotide
30 sequence encoding a soluble PH20 as described elsewhere herein, which can facilitate purification of soluble proteins. For example, soluble PH20 can be expressed as a

- 77 -

recombinant protein with one or more additional polypeptide domains added to facilitate protein purification. Such purification facilitating domains include, but are not limited to, metal chelating peptides such as histidine-tryptophan modules that allow purification on immobilized metals, protein A domains that allow purification
5 on immobilized immunoglobulin and the domain utilized in the FLAGS extension/affinity purification system (Immunex Corp., Seattle Wash.). The inclusion of a cleavable linker sequence such as Factor XA or enterokinase (Invitrogen, San Diego, CA) between the purification domain and the expressed PH20 polypeptide is useful to facilitate purification. One such expression vector provides for expression
10 of a fusion protein containing a soluble PH20 and contains nucleic acid encoding 6 histidine residues followed by thioredoxin and an enterokinase cleavage site. The histidine residues facilitate purification on IMIAC (immobilized metal ion affinity chromatography), while the enterokinase cleavage site provides a means for purifying the polypeptide from the fusion protein.

15 Purity can be assessed by any method known in the art including gel electrophoresis, orthogonal HPLC methods, staining and spectrophotometric techniques. The expressed and purified protein can be analyzed using any assay or method known to one of skill in the art, for example, any described in Section G. These include assays based on the physical and/or functional properties of the protein,
20 including, but not limited to, analysis by gel electrophoresis, immunoassay and assays of hyaluronidase activity.

Depending on the expression system and host cells used, the resulting polypeptide can be heterogeneous due to peptidases present in the culture medium upon production and purification. For example, culture of soluble PH20 in CHO cells
25 can result in a mixture of heterogeneous polypeptides. An exemplary protocol for the generation, production and purification of a soluble PH20 (e.g. rHuPH20) is described in Examples 13-15 below. Similarly, for example, expression of a nucleic acid encoding a polypeptide having a sequence of amino acids 36-497 set forth in SEQ ID NO:60, can result in a heterogeneous mixture of polypeptides variably including
30 polypeptides that end at 497, 496, 495, 494, 493, 492, 491, 490, 489 or shorter.

- 78 -

F. Preparation, Formulation and Administration of Extended Soluble PH20 Polypeptides, and Other Soluble PH20 Polypeptides

Pharmaceutical compositions of soluble PH20 polypeptides, including esPH20, are provided herein for administration. The soluble PH20 polypeptides can be formulated separately, or can be co-formulated or co-administered with pharmaceutical formulations of other therapeutic agents, for example, as described in Section G. The compounds can be formulated into suitable pharmaceutical preparations such as solutions, suspensions, tablets, dispersible tablets, pills, capsules, powders, sustained release formulations or elixirs, for oral administration, as well as transdermal patch preparation and dry powder inhalers. Typically, the compounds are formulated into pharmaceutical compositions using techniques and procedures well known in the art (see e.g., Ansel *Introduction to Pharmaceutical Dosage Forms*, Fourth Edition, 1985, 126).

Typically, a therapeutically effective dosage is contemplated. The amount of a selected soluble PH20 to be administered for the treatment of a disease or condition can be determined by standard clinical techniques. In addition, *in vitro* assays and animal models can be employed to help identify optimal dosage ranges. The precise dosage, which can be determined empirically, can depend on the particular enzyme, the route of administration, the type of disease to be treated and the seriousness of the disease.

Hence, it is understood that the precise dosage and duration of treatment is a function of the disease being treated and can be determined empirically using known testing protocols or by extrapolation from *in vivo* or *in vitro* test data. It is to be noted that concentrations and dosage values also can vary with the severity of the condition to be alleviated. It is to be further understood that for any particular subject, specific dosage regimens should be adjusted over time according to the individual need and the professional judgment of the person administering or supervising the administration of the compositions, and that the concentration ranges set forth herein are exemplary only and are not intended to limit the scope or use of compositions and combinations containing them. The compositions can be administered hourly, daily, weekly, monthly, yearly or once. Generally, dosage regimens are chosen to limit

- 79 -

toxicity. It should be noted that the attending physician would know how to and when to terminate, interrupt or adjust therapy to lower dosage due to toxicity, or bone marrow, liver or kidney or other tissue dysfunctions. Conversely, the attending physician would also know how to and when to adjust treatment to higher levels if the clinical response is not adequate (precluding toxic side effects).

Pharmaceutically acceptable compositions are prepared in view of approvals for a regulatory agency or other agency prepared in accordance with generally recognized pharmacopeia for use in animals and in humans. Compositions can take the form of solutions, suspensions, emulsion, tablets, pills, capsules, powders, and sustained release formulations. A composition can be formulated as a suppository, with traditional binders and carriers such as triglycerides. Oral formulation can include standard carriers such as pharmaceutical grades of mannitol, lactose, starch, magnesium stearate, sodium saccharine, cellulose, magnesium carbonate, and other such agents. The formulation should suit the mode of administration.

Pharmaceutical compositions can include carriers such as a diluent, adjuvant, excipient, or vehicle with which an soluble PH20 is administered. Examples of suitable pharmaceutical carriers are described in "Remington's Pharmaceutical Sciences" by E. W. Martin. Such compositions will contain a therapeutically effective amount of the compound, generally in purified form, together with a suitable amount of carrier so as to provide the form for proper administration to the patient. Such pharmaceutical carriers can be sterile liquids, such as water and oils, including those of petroleum, animal, vegetable or synthetic origin, such as peanut oil, soybean oil, mineral oil, and sesame oil. Water is a typical carrier when the pharmaceutical composition is administered intravenously. Saline solutions and aqueous dextrose and glycerol solutions also can be employed as liquid carriers, particularly for injectable solutions. Compositions can contain along with an active ingredient: a diluent such as lactose, sucrose, dicalcium phosphate, or carboxymethylcellulose; a lubricant, such as magnesium stearate, calcium stearate and talc; and a binder such as starch, natural gums, such as gum acacia, gelatin, glucose, molasses, polyvinylpyrrolidone, celluloses and derivatives thereof, povidone, crospovidones and other such binders known to those of skill in the art. Suitable pharmaceutical

- 80 -

excipients include starch, glucose, lactose, sucrose, gelatin, malt, rice, flour, chalk, silica gel, sodium stearate, glycerol monostearate, talc, sodium chloride, dried skim milk, glycerol, propylene, glycol, water, and ethanol. A composition, if desired, also can contain minor amounts of wetting or emulsifying agents, or pH buffering agents, for example, acetate, sodium citrate, cyclodextrine derivatives, sorbitan monolaurate, triethanolamine sodium acetate, triethanolamine oleate, and other such agents.

Formulations of pharmaceutically therapeutically active compounds and derivatives thereof are provided for administration to humans and animals in unit dosage forms or multiple dosage forms. For example compounds can be formulated as tablets, capsules, pills, powders, granules, sterile parenteral solutions or suspensions, and oral solutions or suspensions, and oil water emulsions containing suitable quantities of the compounds or pharmaceutically acceptable derivatives thereof. Each unit dose contains a predetermined quantity of therapeutically active compound sufficient to produce the desired therapeutic effect, in association with the required pharmaceutical carrier, vehicle or diluent. Examples of unit dose forms include ampoules and syringes and individually packaged tablets or capsules. Unit dose forms can be administered in fractions or multiples thereof. A multiple dose form is a plurality of identical unit dosage forms packaged in a single container to be administered in segregated unit dose form. Examples of multiple dose forms include vials, bottles of tablets or capsules or bottles of pints or gallons. Hence, multiple dose form is a multiple of unit doses that are not segregated in packaging. Generally, dosage forms or compositions containing active ingredient in the range of 0.005% to 100% with the balance made up from non-toxic carrier can be prepared.

Compositions provided herein typically are formulated for administration by subcutaneous route, although other routes of administration are contemplated, such as any route known to those of skill in the art including intramuscular, intraperitoneal, intravenous, intradermal, intralesional, intraperitoneal injection, epidural, vaginal, rectal, local, otic, transdermal administration or any route. Formulations suited for such routes are known to one of skill in the art. Administration can be local, topical or systemic depending upon the locus of treatment. Local administration to an area in need of treatment can be achieved by, for example, but not limited to, local infusion

- 81 -

during surgery, topical application, *e.g.*, in conjunction with a wound dressing after surgery, by injection, by means of a catheter, by means of a suppository, or by means of an implant. Compositions also can be administered with other biologically active agents, either sequentially, intermittently or in the same composition.

5 The most suitable route in any given case depends on a variety of factors, such as the nature of the disease, the tolerance of the subject to a particular administration route, the severity of the disease, and the particular composition that is used. Typically, the compositions provided herein are administered parenterally. In some examples, soluble PH20 compositions are administered so that they reach the
10 interstitium of skin or tissues, thereby degrading the interstitial space for subsequent delivery of a therapeutic agent. Thus, in some examples, direct administration under the skin, such as by subcutaneous administration methods, is contemplated. Thus, in one example, local administration can be achieved by injection, such as from a syringe or other article of manufacture containing an injection device such as a needle.
15 In another example, local administration can be achieved by infusion, which can be facilitated by the use of a pump or other similar device. Other modes of administration also are contemplated. Pharmaceutical compositions can be formulated in dosage forms appropriate for each route of administration.

Administration methods can be employed to decrease the exposure of selected
20 soluble PH20 polypeptides to degradative processes, such as proteolytic degradation and immunological intervention via antigenic and immunogenic responses. Examples of such methods include local administration at the site of treatment. Pegylation of therapeutics has been reported to increase resistance to proteolysis, increase plasma half-life, and decrease antigenicity and immunogenicity. Examples of pegylation
25 methodologies are known in the art (see for example, Lu and Felix, *Int. J. Peptide Protein Res.*, 43: 127-138, 1994; Lu and Felix, *Peptide Res.*, 6: 142-6, 1993; Felix *et al.*, *Int. J. Peptide Res.*, 46 : 253-64, 1995; Benhar *et al.*, *J. Biol. Chem.*, 269: 13398-404, 1994; Brumeanu *et al.*, *J Immunol.*, 154: 3088-95, 1995; see also, Caliceti *et al.* (2003) *Adv. Drug Deliv. Rev.* 55(10):1261-77 and Molineux (2003) *Pharmacotherapy*
30 23 (8 Pt 2):3S-8S). Pegylation also can be used in the delivery of nucleic acid

- 82 -

molecules *in vivo*. For example, pegylation of adenovirus can increase stability and gene transfer (see, e.g., Cheng *et al.* (2003) *Pharm. Res.* 20(9): 1444-51).

1. Injectables, solutions and emulsions

Parenteral administration, generally characterized by injection or infusion,
5 either subcutaneously, intramuscularly, intravenous or intradermally is contemplated herein. Injectables can be prepared in conventional forms, either as liquid solutions or suspensions, solid forms suitable for solution or suspension in liquid prior to injection, or as emulsions. Suitable excipients are, for example, water, saline, dextrose, glycerol or ethanol. The pharmaceutical compositions may contain other minor amounts of
10 non-toxic auxiliary substances such as wetting or emulsifying agents, pH buffering agents, stabilizers, solubility enhancers, and other such agents, such as for example, sodium acetate, sodium phosphate, sorbitan monolaurate, triethanolamine oleate and cyclodextrins. Implantation of a slow-release or sustained-release system, such that a constant level of dosage is maintained (see, e. g., U. S. Patent No. 3,710,795) is also
15 contemplated herein. The percentage of active compound contained in such parenteral compositions is highly dependent on the specific nature thereof, as well as the activity of the compound and the needs of the subject.

Injectables are designed for local and systemic administration. For purposes herein, local administration is desired for direct administration to the affected
20 interstitium. Preparations for parenteral administration include sterile solutions ready for injection, sterile dry soluble products, such as lyophilized powders, ready to be combined with a solvent just prior to use, including hypodermic tablets, sterile suspensions ready for injection, sterile dry insoluble products ready to be combined with a vehicle just prior to use and sterile emulsions. The solutions may be either
25 aqueous or nonaqueous. If administered intravenously, suitable carriers include physiological saline or phosphate buffered saline (PBS), and solutions containing thickening and solubilizing agents, such as glucose, polyethylene glycol, and polypropylene glycol and mixtures thereof.

Pharmaceutically acceptable carriers used in parenteral preparations include
30 aqueous vehicles, nonaqueous vehicles, antimicrobial agents, isotonic agents, buffers, antioxidants, local anesthetics, suspending and dispersing agents, emulsifying agents,

- 83 -

sequestering or chelating agents and other pharmaceutically acceptable substances. Examples of aqueous vehicles include Sodium Chloride Injection, Ringers Injection, Isotonic Dextrose Injection, Sterile Water Injection, Dextrose and Lactated Ringers Injection. Nonaqueous parenteral vehicles include fixed oils of vegetable origin, cottonseed oil, corn oil, sesame oil and peanut oil. Antimicrobial agents in bacteriostatic or fungistatic concentrations can be added to parenteral preparations packaged in multiple-dose containers, which include phenols or cresols, mercurials, benzyl alcohol, chlorobutanol, methyl and propyl p-hydroxybenzoic acid esters, thimerosal, benzalkonium chloride and benzethonium chloride. Isotonic agents include sodium chloride and dextrose. Buffers include phosphate and citrate. Antioxidants include sodium bisulfate. Local anesthetics include procaine hydrochloride. Suspending and dispersing agents include sodium carboxymethylcellulose, hydroxypropyl methylcellulose and polyvinylpyrrolidone. Emulsifying agents include Polysorbate 80 (TWEEN 80). A sequestering or chelating agent of metal ions include EDTA. Pharmaceutical carriers also include ethyl alcohol, polyethylene glycol and propylene glycol for water miscible vehicles and sodium hydroxide, hydrochloric acid, citric acid or lactic acid for pH adjustment.

The concentration of the pharmaceutically active compound is adjusted so that an injection or infusion provides an effective amount to produce the desired pharmacological effect, such as glycemic control. The exact dose depends on the age, weight and condition of the patient or animal as is known in the art. The unit-dose parenteral preparations can be packaged in, for example, an ampoule, a cartridge, a vial or a syringe with a needle. The volume of liquid solution or reconstituted powder preparation, containing the pharmaceutically active compound, is a function of the disease to be treated and the particular article of manufacture chosen for package. All preparations for parenteral administration must be sterile, as is known and practiced in the art.

In one example, pharmaceutical preparation can be in liquid form, for example, solutions, syrups or suspensions. If provided in liquid form, the pharmaceutical preparations can be provided as a concentrated preparation to be diluted to a therapeutically effective concentration before use. Such liquid

- 84 -

preparations can be prepared by conventional means with pharmaceutically acceptable additives such as suspending agents (*e.g.*, sorbitol syrup, cellulose derivatives or hydrogenated edible fats); emulsifying agents (*e.g.*, lecithin or acacia); non-aqueous vehicles (*e.g.*, almond oil, oily esters, or fractionated vegetable oils); and
5 preservatives (*e.g.*, methyl or propyl-p-hydroxybenzoates or sorbic acid). In another example, pharmaceutical preparations can be presented in lyophilized form for reconstitution with water or other suitable vehicle before use.

Lyophilized Powders

Of interest herein are lyophilized powders, which can be reconstituted for
10 administration as solutions, emulsions and other mixtures. They may also be reconstituted and formulated as solids or gels.

The sterile, lyophilized powder is prepared by dissolving a compound of inactive enzyme in a buffer solution. The buffer solution may contain an excipient which improves the stability or other pharmacological component of the powder or
15 reconstituted solution, prepared from the powder. Subsequent sterile filtration of the solution followed by lyophilization under standard conditions known to those of skill in the art provides the desired formulation. Briefly, the lyophilized powder is prepared by dissolving an excipient, such as dextrose, sorbitol, fructose, corn syrup, xylitol, glycerin, glucose, sucrose or other suitable agent, in a suitable buffer, such as citrate,
20 sodium or potassium phosphate or other such buffer known to those of skill in the art. Then, a selected enzyme is added to the resulting mixture, and stirred until it dissolves. The resulting mixture is sterile filtered or treated to remove particulates and to insure sterility, and apportioned into vials for lyophilization. Each vial will contain a single dosage or multiple dosages of the compound. The lyophilized powder can be
25 stored under appropriate conditions, such as at about 4 °C to room temperature. Reconstitution of this lyophilized powder with an appropriate buffer solution provides a formulation for use in parenteral administration.

2. Topical Administration

Topical mixtures are prepared as described for the local and systemic
30 administration. The resulting mixture can be a solution, suspension, emulsions or the like and are formulated as creams, gels, ointments, emulsions, solutions, elixirs,

- 85 -

lotions, suspensions, tinctures, pastes, foams, aerosols, irrigations, sprays, suppositories, bandages, dermal patches or any other formulations suitable for topical administration.

The compounds or pharmaceutically acceptable derivatives thereof may be formulated as aerosols for topical application, such as by inhalation (see, e.g., U. S. Patent Nos. 4,044,126, 4,414,209, and 4,364,923, which describe aerosols for delivery of a steroid useful for treatment inflammatory diseases, particularly asthma). These formulations for administration to the respiratory tract can be in the form of an aerosol or solution for a nebulizer, or as a microfine powder for insufflation, alone or in combination with an inert carrier such as lactose. In such a case, the particles of the formulation will typically have diameters of less than 50 microns, or less than 10 microns.

The compounds can be formulated for local or topical application, such as for topical application to the skin and mucous membranes, such as in the eye, in the form of gels, creams, and lotions and for application to the eye or for intracisternal or intraspinal application. Topical administration is contemplated for transdermal delivery and also for administration to the eyes or mucosa, or for inhalation therapies. Nasal solutions of the active compound alone or in combination with other pharmaceutically acceptable excipients also can be administered.

Formulations suitable for transdermal administration are provided. They can be provided in any suitable format, such as discrete patches adapted to remain in intimate contact with the epidermis of the recipient for a prolonged period of time. Such patches contain the active compound in optionally buffered aqueous solution of, for example, 0.1 to 0.2 M concentration with respect to the active compound. Formulations suitable for transdermal administration also can be delivered by iontophoresis (see, e.g., *Pharmaceutical Research* 3(6):318 (1986)) and typically take the form of an optionally buffered aqueous solution of the active compound.

3. Compositions for other routes of administration

Depending upon the condition treated other routes of administration, such as topical application, transdermal patches, oral and rectal administration are also contemplated herein. For example, pharmaceutical dosage forms for rectal

- 86 -

administration are rectal suppositories, capsules and tablets for systemic effect. Rectal suppositories include solid bodies for insertion into the rectum which melt or soften at body temperature releasing one or more pharmacologically or therapeutically active ingredients. Pharmaceutically acceptable substances utilized in rectal suppositories are bases or vehicles and agents to raise the melting point. Examples of bases include cocoa butter (theobroma oil), glycerin-gelatin, carbowax (polyoxyethylene glycol) and appropriate mixtures of mono-, di- and triglycerides of fatty acids. Combinations of the various bases may be used. Agents to raise the melting point of suppositories include spermaceti and wax. Rectal suppositories may be prepared either by the compressed method or by molding. The typical weight of a rectal suppository is about 2 to 3 gm. Tablets and capsules for rectal administration are manufactured using the same pharmaceutically acceptable substance and by the same methods as for formulations for oral administration.

Formulations suitable for rectal administration can be provided as unit dose suppositories. These can be prepared by admixing the active compound with one or more conventional solid carriers, for example, cocoa butter, and then shaping the resulting mixture.

For oral administration, pharmaceutical compositions can take the form of, for example, tablets or capsules prepared by conventional means with pharmaceutically acceptable excipients such as binding agents (*e.g.*, pregelatinized maize starch, polyvinyl pyrrolidone or hydroxypropyl methylcellulose); fillers (*e.g.*, lactose, microcrystalline cellulose or calcium hydrogen phosphate); lubricants (*e.g.*, magnesium stearate, talc or silica); disintegrants (*e.g.*, potato starch or sodium starch glycolate); or wetting agents (*e.g.*, sodium lauryl sulphate). The tablets can be coated by methods well-known in the art.

Formulations suitable for buccal (sublingual) administration include, for example, lozenges containing the active compound in a flavored base, usually sucrose and acacia or tragacanth; and pastilles containing the compound in an inert base such as gelatin and glycerin or sucrose and acacia.

Pharmaceutical compositions also can be administered by controlled release formulations and/or delivery devices (see, *e.g.*, in U.S. Patent Nos. 3,536,809;

- 87 -

3,598,123; 3,630,200; 3,845,770; 3,847,770; 3,916,899; 4,008,719; 4,687,610;
4,769,027; 5,059,595; 5,073,543; 5,120,548; 5,354,566; 5,591,767; 5,639,476;
5,674,533 and 5,733,566).

Various delivery systems are known and can be used to administer selected
5 soluble PH20 polypeptides, such as but not limited to, encapsulation in liposomes,
microparticles, microcapsules, recombinant cells capable of expressing the
compound, receptor mediated endocytosis, and delivery of nucleic acid molecules
encoding selected soluble PH20 polypeptides such as retrovirus delivery systems.

Hence, in certain embodiments, liposomes and/or nanoparticles also can be
10 employed with administration of soluble PH20 polypeptides. Liposomes are formed
from phospholipids that are dispersed in an aqueous medium and spontaneously form
multilamellar concentric bilayer vesicles (also termed multilamellar vesicles
(MLVs)). MLVs generally have diameters of from 25 nm to 4 μ m. Sonication of
MLVs results in the formation of small unilamellar vesicles (SUVs) with diameters in
15 the range of 200 to 500 angstroms containing an aqueous solution in the core.

Phospholipids can form a variety of structures other than liposomes when
dispersed in water, depending on the molar ratio of lipid to water. At low ratios, the
liposomes form. Physical characteristics of liposomes depend on pH, ionic strength
and the presence of divalent cations. Liposomes can show low permeability to ionic
20 and polar substances, but at elevated temperatures undergo a phase transition which
markedly alters their permeability. The phase transition involves a change from a
closely packed, ordered structure, known as the gel state, to a loosely packed, less-
ordered structure, known as the fluid state. This occurs at a characteristic phase-
transition temperature and results in an increase in permeability to ions, sugars and
25 drugs.

Liposomes interact with cells via different mechanisms: endocytosis by
phagocytic cells of the reticuloendothelial system such as macrophages and
neutrophils; adsorption to the cell surface, either by nonspecific weak hydrophobic or
electrostatic forces, or by specific interactions with cell-surface components; fusion
30 with the plasma cell membrane by insertion of the lipid bilayer of the liposome into
the plasma membrane, with simultaneous release of liposomal contents into the

- 88 -

cytoplasm; and by transfer of liposomal lipids to cellular or subcellular membranes, or vice versa, without any association of the liposome contents. Varying the liposome formulation can alter which mechanism is operative, although more than one can operate at the same time. Nanocapsules can generally entrap compounds in a stable and reproducible way. To avoid side effects due to intracellular polymeric overloading, such ultrafine particles (sized around 0.1 μm) should be designed using polymers able to be degraded *in vivo*. Biodegradable polyalkyl-cyanoacrylate nanoparticles that meet these requirements are contemplated for use herein, and such particles can be easily made.

4. Dosage and Administration

The soluble PH20 polypeptides, including esPH20, provided herein can be formulated as pharmaceutical compositions for single dosage or multiple dosage administration. The selected hyaluronan degrading enzyme is included in an amount sufficient to exert a therapeutically useful effect in the absence of undesirable side effects on the patient treated. The therapeutically effective concentration can be determined empirically by testing the polypeptides in known *in vitro* and *in vivo* systems such as by using the assays provided herein or known in the art (see e.g., Taliani et al. (1996) *Anal. Biochem.*, 240: 60-67; Filocamo et al. (1997) *J Virology*, 71: 1417-1427; Sudo et al. (1996) *Antiviral Res.* 32: 9-18; Buffard et al. (1995) *Virology*, 209:52-59; Bianchi et al. (1996) *Anal. Biochem.*, 237: 239-244; Hamatake et al. (1996) *Intervirology* 39:249-258; Steinkuhler et al. (1998) *Biochem.*, 37:8899-8905; D'Souza et al. (1995) *J Gen. Virol.*, 76:1729-1736; Takeshita et al. (1997) *Anal. Biochem.*, 247:242-246; see also e.g., Shimizu et al. (1994) *J. Virol.* 68:8406-8408; Mizutani et al. (1996) *J. Virol.* 70:7219-7223; Mizutani et al. (1996) *Biochem. Biophys. Res. Commun.*, 227:822-826; Lu et al. (1996) *Proc. Natl. Acad. Sci (USA)*, 93:1412-1417; Hahm et al., (1996) *Virology*, 226:318-326; Ito et al. (1996) *J. Gen. Virol.*, 77:1043-1054; Mizutani et al. (1995) *Biochem. Biophys. Res. Commun.*, 212:906-911; Cho et al. (1997) *J. Virol. Meth.* 65:201-207 and then extrapolated therefrom for dosages for humans.

Typically, a therapeutically effective dose of a soluble PH20 enzyme is at or about 10 Unit (U) to 500,000 Units, 100 Units to 100,000 Units, 500 Units to 50,000

- 89 -

Units, 1000 Units to 10,000 Units, 5000 Units to 7500 Units, 5000 Units to 50,000 Units, or 1,000 Units to 10,000 Units, generally 1,000 to 50,000 Units, in a stabilized solution or suspension or a lyophilized form. The formulations can be provided in unit-dose forms such as, but not limited to, ampoules, syringes and individually
5 packaged tablets or capsules. The dispersing agent can be administered alone, or with other pharmacologically effective agent or therapeutic agent in a total volume of 0.1 -100 ml, 1 -50 ml, 10- 50 ml, 10-30 ml, 1-20 ml, or 1-10 ml, typically 10-50 ml.

For example, a soluble PH20, including esPH20, can be administered subcutaneously at or about 10 U, 20 U, 30 U, 40 U, 50 U, 100 U, 150 U, 200 U, 250
10 U, 300 U, 350 U, 400 U, 450 U, 500 U, 600 U, 700 U, 800 U, 900 U, 1000 U, 2,000 U, 3,000 U, 4,000 Units, 5,000 U or more. In some examples, dosages can be provided as a ratio of amount of a soluble PH20 to therapeutic agent administered. For example, a soluble PH20 polypeptide can be administered at 1 hyaluronidase U/therapeutic agent U (1:1) to 50:1 or more, for example, at or about 1:1, 2:1, 3:1,
15 4:1, 5:1, 6:1, 7:1, 8:1, 9:1, 10:1, 11:1, 12:1, 13:1, 14:1, 15:1, 20:1, 25:1, 30:1, 35:1, 40:1, 45:1, 50:1 or more. Typically, volumes of injections or infusions of a soluble PH20 contemplated herein are from at or about 0.01 mL, 0.05 mL, 0.1 mL, 0.2 mL, 0.3 mL, 0.4 mL, 0.5 mL, 1 mL, 2 mL, 3 mL, 4 mL, 5 mL, 6 mL, 7 mL, 8 mL, 9 ml, 10 ml, 20 ml, 30 ml, 40 ml, 50 ml or more. The soluble PH20 can be provided as a stock
20 solution at or about 100 U/ml, 150 U/ml, 200 U/ml, 300 U/ml, 400 U/ml, 500 U/mL, 600 U/mL, 800 U/mL or 1000 U/mL, or can be provided in a more concentrated form, for example at or about 2000 U/ml, 3000 Units/ml, 4000 U/ml, 5000 U/ml, 8000 U/ml, 10,000 U/mL or 20,000 U/mL for use directly or for dilution to the effective concentration prior to use. The soluble PH20 can be provided as a liquid or
25 lyophilized formulation.

5. Packaging, Articles of Manufacture and Kits

Pharmaceutical compounds of soluble PH20 polypeptides, including esPH20, or nucleic acids encoding such polypeptides, or a derivative or variant thereof can be packaged as articles of manufacture containing packaging material, a pharmaceutical
30 composition which is effective for treating a disease or disorder, and a label that indicates that the soluble PH20 or nucleic acid molecule is to be used for treating the

- 90 -

disease or disorder. Combinations of a selected soluble PH20 hyaluronidase, or derivative or variant thereof and an therapeutic agent also can be packaged in an article of manufacture.

The articles of manufacture provided herein contain packaging materials.

- 5 Packaging materials for use in packaging pharmaceutical products are well known to those of skill in the art. See, for example, U.S. Patent Nos. 5,323,907, 5,052,558 and 5,033,252, each of which is incorporated herein in its entirety. Examples of pharmaceutical packaging materials include, but are not limited to, blister packs, bottles, tubes, inhalers, pumps, bags, vials, containers, syringes, bottles, and any
- 10 packaging material suitable for a selected formulation and intended mode of administration and treatment. The articles of manufacture can include a needle or other injection device so as to facilitate administration (e.g. sub-epidermal administration) for local injection purposes. A wide array of formulations of the compounds and compositions provided herein are contemplated including a soluble
- 15 PH20, such as an esPH20, and a therapeutic agent known to treat a particular disease or disorder. The choice of package depends on the soluble PH20 and/or therapeutic agent, and whether such compositions will be packaged together or separately. In one example, the soluble PH20 can be packaged as a mixture with the therapeutic agent. In another example, the components can be packaged as separate compositions
- 20 Selected soluble PH20 polypeptides, such as esPH20 polypeptides, therapeutic agents and/or articles of manufacture thereof also can be provided as kits. Kits can include a pharmaceutical composition described herein and an item for administration provided as an article of manufacture. For example a soluble PH20 polypeptide can be supplied with a device for administration, such as a syringe, an inhaler, a dosage
- 25 cup, a dropper, or an applicator. The compositions can be contained in the item for administration or can be provided separately to be added later. The kit can, optionally, include instructions for application including dosages, dosing regimens and instructions for modes of administration. Kits also can include a pharmaceutical composition described herein and an item for diagnosis. For example, such kits can
- 30 include an item for measuring the concentration, amount or activity of the selected protease in a subject.

- 91 -

G. Assays

Soluble PH20 polypeptides provided herein, including esPH20 polypeptides, are soluble and retain a hyaluronidase enzymatic activity. N-glycosylated or N-partially glycosylated PH20 polypeptides provided herein retain a hyaluronidase enzymatic activity. The activity of a PH20 provided herein is or is about 30%, 40%, 50%, 60%, 70%, 80%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more compared to the activity of a corresponding PH20 that is not C-terminally truncated or N-partially glycosylated. The activity of a soluble PH20 hyaluronidase polypeptide, such as an esPH20, can be assessed using methods well known in the art. These methods include, for example, a microturbidity assay and a microtiter assay using biotinylated hyaluronic acid. Activity and assessments can be performed on conditioned medium or supernatants or on purified protein. The solubility of a protein also can be determined, for example, by a Triton® X-114 partition assay. In all assays, the activity or solubility of a soluble PH20 can be compared to a control, for example, a full length PH20 lacking C-terminal truncations.

1. Hyaluronidase Activity

The activity of a soluble PH20 polypeptide can be assessed using methods well known in the art. For example, the USP XXII assay for hyaluronidase determines activity indirectly by measuring the amount of undegraded hyaluronic acid, or hyaluronan, (HA) substrate remaining after the enzyme is allowed to react with the HA for 30 min at 37 °C (USP XXII-NF XVII (1990) 644-645 United States Pharmacopeia Convention, Inc, Rockville, MD). A Hyaluronidase Reference Standard (USP) or National Formulary (NF) Standard Hyaluronidase solution can be used in an assay to ascertain the activity, in units, of any hyaluronidase.

In one example, activity is measured using a microturbidity assay, as described in Example 12. This is based on the formation of an insoluble precipitate when hyaluronic acid binds with serum albumin. The activity is measured by incubating hyaluronidase with sodium hyaluronate (hyaluronic acid) for a set period of time (e.g. 10 minutes) and then precipitating the undigested sodium hyaluronate with the addition of acidified serum albumin. The turbidity of the resulting sample is measured at 640 nm after an additional development period. The decrease in turbidity

- 92 -

resulting from hyaluronidase activity on the sodium hyaluronate substrate is a measure of hyaluronidase enzymatic activity.

In another example, hyaluronidase activity is measured using a microtiter assay in which residual biotinylated hyaluronic acid is measured following incubation with hyaluronidase (see e.g. Frost and Stern (1997) *Anal. Biochem.* 251:263-269, U.S. Patent Publication No. 20050260186). In Example 4, the hyaluronidase activity of truncated human PH20 hyaluronidase is determined using biotinylated hyaluronic acid. The free carboxyl groups on the glucuronic acid residues of hyaluronic acid are biotinylated, and the biotinylated hyaluronic acid substrate is covalently coupled to a microtiter plate. Following incubation with hyaluronidase, the residual biotinylated hyaluronic acid substrate is detected using an avidin-peroxidase reaction, and compared to that obtained following reaction with hyaluronidase standards of known activity. As the substrate is covalently bound to the microtiter plate, artifacts such as pH-dependent displacement of the biotinylated substrate does not occur. The sensitivity permits rapid measurement of hyaluronidase activity from cultured cells and biological samples with an inter-assay variation of less than 10%.

Other assays to measure hyaluronidase activity also are known in the art and can be used in the methods herein (see e.g. Delpech et al., (1995) *Anal. Biochem.* 229:35-41; Takahashi et al., (2003) *Anal. Biochem.* 322:257-263).

Many hyaluronidase assays have been based upon the measurement of the generation of new reducing N-acetylamino groups (Bonner and Cantey, *Clin. Chim. Acta* 13:746-752, 1966), or loss of viscosity (De Saegui et al., *Arch. Biochem. Biophys.* 121:548-554, 1967) or turbidity (Dorfman and Ott, *J. Biol. Chem.* 172:367, 1948). With purified substrates all of these methods suffice for determination of the presence or absence of endoglucosamidic activity.

Substantially purified glycosaminoglycan substrates can also be used in a Gel Shift Assay. Glycosaminoglycans are mixed with recombinant PH20, such as a soluble PH20, to test for endoglucosidase activity that results in a shift in substrate mobility within the gel. Exemplary of such substrates include, but are not limited to, chondroitin-4 and 6 sulfate, dermatan sulfate, heparan-sulfate, which can be obtained from Sigma Chemical. Human umbilical cord Hyaluronan can be obtained from ICN.

- 93 -

For example, each test substrate can be diluted to at or about 0.1 mg/ml in a buffer range from pH 3.5-7.5. In such an exemplary assay, at or about 10 μ l samples of purified soluble PH20 or conditioned media from PH20 expressing cells can be mixed with at or about 90 μ l of test substrate in desired buffer and incubated for 3 hours at 37 °C. Following incubation, samples are neutralized with sample buffer (Tris EDTA pH 8.0, Bromophenol Blue and glycerol) followed by electrophoresis.

Glycosaminoglycans can be detected using any method known in the art, for example, glycosaminoglycans can be detected by staining the gels using 0.5% Alcian Blue in 3% Glacial Acetic Acid overnight followed by destaining in 7% Glacial Acetic Acid. Degradation is determined by comparison of substrate mobility in the presence and absence of enzyme.

Hyaluronidase activity can also be detected by substrate gel zymography (Guentenhoner et al., 1992, *Matrix* 388-396). In this assay a sample is applied to a SDS-PAGE gel containing hyaluronic acid and the proteins in the sample separated by electrophoresis. The gel is then incubated in an enzyme assay buffer and subsequently stained to detect the hyaluronic acid in the gel. Hyaluronidase activity is visualized as a cleared zone in the substrate gel.

The ability of a soluble PH20 polypeptide to act as a spreading or diffusing agent also can be assessed. For example, trypan blue dye can be injected subcutaneously with or without a soluble PH20 into the lateral skin on each side of nude mice. The dye area is then measured, such as with a microcaliper, to determine the ability of the hyaluronan degrading enzyme to act as a spreading agent (U.S. Patent No. 20060104968). The effect of co-administration of hyaluronidase with another agent, for example a therapeutic agent, on the pharmacokinetic and pharmacodynamic properties of that agent also can be assessed *in vivo* using animal model and/or human subjects, such as in the setting of a clinical trial.

The functional activity of a soluble PH20, such as esPH20 can be compared and/or normalized to a reference standard using any of these assays. This can be done to determine what a functionally equivalent amount of a soluble PH20 is. For example, the ability of a soluble PH20 to act as a spreading or diffusing agent can be assessed by injecting it into the lateral skin of mice with trypan blue, and the amount

- 94 -

required to achieve the same amount of diffusion as, for example, 100 units of a Hyaluronidase Reference Standard, can be determined. The amount of soluble PH20 required is, therefore, functionally equivalent to 100 hyaluronidase units.

2. Solubility

5 Solubility of a hyaluronidase can be determined by any method known to one of the skill in the art. One method for determining solubility is by detergent partitioning. For example, a soluble PH20 polypeptide can be distinguished, for example, by its partitioning into the aqueous phase of a Triton® X-114 solution at 37 °C (Bordier et al., (1981) *J. Biol. Chem.*, 256:1604-1607). For example, the solubility
10 of the PH20 polypeptides described herein is assessed as described in Example 4. Membrane-anchored hyaluronidases, such as lipid-anchored hyaluronidases, including GPI-anchored hyaluronidases, will partition into the detergent-rich phase, but will partition into the detergent-poor or aqueous phase following treatment with Phospholipase C. Phospholipase C is an enzyme that cleaves the phospho-glycerol
15 bond found in GPI-anchored proteins. Treatment with PLC will cause release of GPI-linked proteins from the outer cell membrane.

Another method for assessing solubility is to determine whether a PH20 polypeptide is GPI-anchored. A GPI-anchored PH20 polypeptide is bound to the cell membrane and therefore insoluble. To determine whether a PH20 polypeptide is GPI-
20 anchored, one can assess solubility before and after PLC/PLD hydrolysis, and also use predictive algorithms to identify a GPI-anchor attachment signal sequence. GPI-anchored proteins can be identified by their solubilization after specific enzymatic or chemical cleavage, in conjunction with detergent partitioning (e.g., in Triton® X-114), antibody recognition, and metabolic radioactive labeling.

25 A common method used to demonstrate that a protein has a GPI anchor is its release from the cell surface or its solubilization by treating with bacterial PI-PLC or trypanosome-derived GPI-specific phospholipase C (GPI-PLC). These enzymes cleave a diacylglycerol in the membrane and produce the immunoreactive glycan epitope (CRD) on the protein, which can be detected by Western blotting with
30 antibodies produced against the GPI of trypanosomes. One common problem with this approach especially encountered in mammalian cells is that the lipases cannot cleave

- 95 -

a GPI anchor in which the inositol is acylated. These require prior treatment with mild alkali to remove the fatty acid on the inositol ring. Alternatively, serum-derived GPI-specific phospholipase D can be used to cleave GPI anchors. This enzyme cleaves between the inositol ring and the phosphatidic acid moiety and is not inhibited by inositol acylation. Hydrofluoric acid cleaves GPI anchors between the inositol ring and phosphatidic acid and also cleaves the phosphodiester linkages between any phosphoethanolamines and mannosyl residues. Dilute nitrous acid is particularly useful in the study of GPI anchors because it cleaves specifically between the nonacetylated glucosamine and the inositol ring, releasing the protein-bound glycan (now containing a diagnostic anhydromannose moiety) and phosphatidylinositol. In combination with CRD antibodies, composition analyses, radioactive labeling with myo-inositol, ethanolamine, glucosamine, mannose, or fatty acids and chromatographic or detergent partitioning methods, these degradation methods represent a powerful set of tools to study GPI anchors on proteins.

Various *in silico* methods and algorithms have been developed that can be used to identify GPI-anchor attachment signal consensus sequences in polypeptides (see, e.g. Udenfriend et al. (1995) *Methods Enzymol.* 250:571-582; Eisenhaber et al., (1999) *J. Biol. Chem.* 272: 741-758, Kronegg and Buloz, (1999); "Detection/prediction of GPI cleavage site (GPI-anchor) in a protein (DGPI)", 129.194.185.165/dgpi/; Fankhauser et al., (2005) *Bioinformatics* 21:1846-1852; Omaetxebarria et al., (2007) *Proteomics* 7:1951-1960; Pierleoni et al., (2008) *BMC Bioinformatics* 9:392); including those that are readily available on bioinformatic websites, such as the ExPASy Proteomics tools site (expasy.ch/tools/). Thus, one of skill in the art can determine whether a PH20 polypeptide contains a GPI-anchor attachment signal sequence, and, therefore, whether the PH20 polypeptide is a GPI-anchored protein.

H. Methods of Treatment and Uses of Extended Soluble PH20 and other Soluble PH20 and Combination Therapy

Various forms of PH20 hyaluronidases have been prepared and approved for therapeutic use in humans. For example, animal-derived hyaluronidase preparations include Vitrase® (ISTA Pharmaceuticals), a purified ovine testicular hyaluronidase,

- 96 -

and Amphadase® (Amphastar Pharmaceuticals), a bovine testicular hyaluronidase. Hylenex® (Halozyme Therapeutics) is a human recombinant hyaluronidase produced by genetically engineered Chinese Hamster Ovary (CHO) cells containing nucleic acid encoding for soluble rHuPH20. Approved therapeutic uses for hyaluronidase
5 include use as an adjuvant to increase the absorption and dispersion of other therapeutic agents, for hypodermoclysis (subcutaneous fluid administration), and as an adjunct in subcutaneous urography for improving resorption of radiopaque agents. In addition to these indications hyaluronidases can be used as a therapeutic or cosmetic agent for the treatment of additional diseases and conditions.

10 Hyaluronidases have also been used to enhance the activity of chemotherapeutics and/or the accessibility of tumors to chemotherapeutics (Schuller et al., 1991, *Proc. Amer. Assoc. Cancer Res.* 32:173, abstract no. 1034; Czejka et al., 1990, *Pharmazie* 45:H.9). Combination chemotherapy with hyaluronidase is effective in the treatment of a variety of cancers including urinary bladder cancer (Horn et al.,
15 1985, *J. Surg. Oncol.* 28:304-307), squamous cell carcinoma (Kohno et al., 94, *J. Cancer Res. Oncol.* 120:293-297), breast cancer (Beckenlehner et al., 1992, *J. Cancer Res. Oncol.* 118:591-596), and gastrointestinal cancer (Scheithauer et al., 1988, *Anticancer Res.* 8:391-396). Hyaluronidase is effective as the sole therapeutic agent in the treatment of brain cancer (gliomas) (PCT published application no. WO88/02261,
20 published Apr. 7, 1988). Administration of hyaluronidase also induces responsiveness of previously chemotherapy-resistant tumors of the pancreas, stomach, colon, ovaries, and breast (Baumgartner et al., 1988, *Reg. Cancer Treat.* 1:55-58; Zanker et al., 1986, *Proc. Amer. Assoc. Cancer Res.* 27:390). Unfortunately, the contaminants and non human nature of such hyaluronidases result in anaphylactic reactions.

25 In addition to its indirect anticancer effects, hyaluronidases also have direct anticarcinogenic effects. Hyaluronidase prevents growth of tumors transplanted into mice (De Maeyer et al., 1992, *Int. J. Cancer* 51:657-660) and inhibits tumor formation upon exposure to carcinogens (Pawlowski et al., 1979, *Int. J. Cancer* 23:105-109; Haberman et al., 1981, Proceedings of the 17th Annual Meeting of the
30 American Society of Clinical Oncology, Washington, D.C., 22:105, abstract no. 415).

- 97 -

In particular, PH20 hyaluronidase can be used to treat hyaluronan-associated diseases or conditions associated with high interstitial fluid pressure, such as disc pressure, proliferative disorders, such as cancer and benign prostatic hyperplasia, and edema. Edema can result from or be manifested in, for example, from organ
5 transplant, stroke or brain trauma. Proliferative disorders include, but are not limited to, cancer, smooth muscle cell proliferation, systemic sclerosis, cirrhosis of the liver, adult respiratory distress syndrome, idiopathic cardiomyopathy, lupus erythematosus, retinopathy, e.g., diabetic retinopathy or other retinopathies, cardiac hyperplasia, reproductive system associated disorders, such as benign prostatic hyperplasia (BPH)
10 and ovarian cysts, pulmonary fibrosis, endometriosis, fibromatosis, hamartomas, lymphangiomatosis, sarcoidosis, desmoid tumors. Cancers include solid and lymphatic/blood tumors and metastatic disease, and undifferentiated tumors. The tumors amenable to treatment typically exhibit cellular and/or stromal expression of a hyaluronan, compared to a non-cancerous tissue of the same tissue type or compared
15 to a non-metastatic tumor of the same tumor-type. Cancers include any one or more of ovarian cancer, in situ carcinoma (ISC), squamous cell carcinoma (SCC), prostate cancer, pancreatic cancer, other gastric cancers, non-small cell lung cancer, breast cancer, brain cancer and colon cancer.

Hence, PH20 hyaluronidases have multiple uses, including and in addition to
20 their use as a spreading agent. Hyaluronidase is commonly used, for example, for peribulbar block in local anesthesia prior ophthalmic surgery. The presence of the enzyme prevents the need for additional blocks and speeds the time to the onset of akinesia (loss of eye movement). Peribulbar and sub-Tenon's block are the most common applications of hyaluronidase for ophthalmic procedures. Hyaluronidase
25 also can promote akinesia in cosmetic surgery, such as blepharoplasties and face lifts. It is understood that soluble PH20 hyaluronidases provided herein, including esPH20 hyaluronidases, can be used in any method of treatment or combination therapy for which a PH20 hyaluronidase is used (see e.g., U.S. Publication Nos. US20040268425; US20050260186; US20060104968; and U.S. Appl. Serial Nos. 12/381,844,
30 12/386,249, 12/387,225 and 12/386,222, incorporated by reference in their entirety). Exemplary therapeutic and cosmetic uses for hyaluronidase are described below.

- 98 -

1. Use as a Spreading Agent and Combination Therapy

As noted above, hyaluronidase is a spreading or diffusing substance which modifies the permeability of connective tissue through the hydrolysis of hyaluronic acid, a polysaccharide found in the intercellular ground substance of connective tissue, and of certain specialized tissues, such as the umbilical cord and vitreous humor. When no spreading factor is present, materials injected subcutaneously, such as drugs, proteins, peptides and nucleic acid, spread very slowly. Co-injection with hyaluronidase, however, can cause rapid spreading. The rate of diffusion is proportional to the amount of enzyme, and the extent of diffusion is proportional to the volume of solution.

PH20, including soluble PH20 such as esPH20 provided herein, can be used to promote or enhance the delivery agents and molecules to any of a variety of mammalian tissues *in vivo*. It can be used to facilitate the diffusion and, therefore, promote the delivery, of small molecule pharmacologic agents as well as larger molecule pharmacologic agents, such as proteins, nucleic acids and ribonucleic acids, and macromolecular compositions that can contain a combination of components including, but not limited to, nucleic acids, proteins, carbohydrates, lipids, lipid-based molecules and drugs (see e.g. U.S. Publication Nos. US20040268425; US20050260186; and US20060104968). PH20, including soluble PH20 such as esPH20 can be co-administered and/or co-formulated with a therapeutic agent to improve the bioavailability as well as pharmacokinetic (PK) and/or pharmacodynamic (PD) characteristics of co-formulated or co-administered agents. PK/PD parameters that can be improved by using soluble PH20, such as esPH20, include such measures as C_{max} (the maximal concentration of agent achieved following absorption in, e.g., the bloodstream), T_{max} (the time required to achieve maximal concentration), $T_{1/2}$ (the time required for the concentration to fall by half), C_{min} (the minimal concentration of agent following metabolism and excretion), AUC (area under the curve of concentration versus time, a measure of the overall amount of bioavailability), concentrations in various tissues of interest (including, e.g., the rate of achieving desired concentrations, the overall levels, and the duration of maintaining desired levels), and E_{max} (the maximal effect achieved).

- 99 -

The methods of treatment provided herein include combination therapies with a therapeutic agent for the treatment of a disease or disorder for which the therapeutic agent threatens. Any therapeutic agent that ameliorates and or otherwise lessens the severity of a disease or condition can be combined with a soluble PH20 provided herein in order to increase the bioavailability of such therapeutic agent. In particular, soluble PH20 polypeptides provided herein, such as esPH20s, can be used in each and all of the combinations described in applications see e.g., U.S. Publication Nos. US20040268425; US20050260186; US20060104968 and U.S. Appl. Serial Nos. 12/381,844, 12/386,249, 12/387,225 and 12/386,222 in place of the disclosed hyaluronidase or hyaluronidase degrading enzyme.

Soluble PH20 polypeptides provided herein, in particular esPH20 polypeptides, can be administered prior, subsequently, intermittently or simultaneously to the therapeutic agent preparation. Generally, the soluble PH20 is administered prior to or simultaneously with administration of the therapeutic agent preparation to permit the soluble PH20 to degrade the hyaluronic acid in the interstitial space. The soluble PH20 can be administered at a site different from the site of administration of the therapeutic molecule or the soluble PH20 can be administered at a site the same as the site of administration of the therapeutic molecule.

Examples of pharmaceutical, therapeutic and cosmetic agents and molecules that can be administered with hyaluronidase include, but are not limited to, a chemotherapeutic or anticancer agent, an analgesic agent, an antibiotic agent, an anti-inflammatory agent, an antimicrobial agent, an amoebicidal agent, a trichomonocidal agent, an anti-parkinson agent, an anti-malarial agent, an anticonvulsant agent, an anti-depressant agent, an anti-arthritis agent, an anti-fungal agent, an antihypertensive agent, an antipyretic agent, an anti-parasitic agent, an antihistamine agent, an alpha-adrenergic agonist agent, an alpha blocker agent, an anesthetic agent, a bronchial dilator agent, a biocide agent, a bactericide agent, a bacteriostatic agent, a beta adrenergic blocker agent, a calcium channel blocker agent, a cardiovascular drug agent, a contraceptive agent, a cosmetic or esthetic agent, a decongestant agent, a diuretic agent, a depressant agent, a diagnostic agent, an electrolyte agent, a hypnotic

- 100 -

agent, a hormone agent, a hyperglycemic agent, a muscle relaxant agent, a muscle contractant agent, an ophthalmic agent, a parasympathomimetic agent, a psychic energizer agent, a sedative agent, a sleep inducer, a sympathomimetic agent, a tranquilizer agent, a urinary agent, a vaginal agent, a viricide agent, a vitamin agent, a
5 non-steroidal anti-inflammatory agent, or an angiotensin converting enzyme inhibitor agent, and any combination thereof. In particular, therapeutic agents include antibodies, including monoclonal antibodies, bisphosphonates, insulins and immunoglobulins.

For example, exemplary antibiotic agents include, but are not limited to,
10 Aminoglycosides; Amphenicols; Ansamycins; Carbacephem; Carbapenems; Cephalosporins or Cephems; Cephamycins; Clavams; Cyclic lipopeptides; Diaminopyrimidines; Ketolides; Lincosamides; Macrolides; Monobactams; Nitrofurans; Oxacephem; Oxazolidinones; Penems, thienamycins and miscellaneous beta-lactams; Penicillins; Polypeptides antibiotics; Quinolones; Sulfonamides;
15 Sulfones; Tetracyclines; and other antibiotics (such as Clofoctols, Fusidic acids, Hexedines, Methenamines, Nitrofurantoin, Nitroxolines, Ritipenems, Taurolidines, Xibomols).

Also included among exemplary therapeutic agents are blood modifiers such as antihemophilic factors, anti-inhibitor coagulant complexes, antithrombin IIIs,
20 coagulations Factor Vhs, coagulation Factor VIIIs, coagulation Factor IXs, plasma protein fractions, von Willebrand factors; antiplatelet agents (including, for example, abciximabs, anagrelides, cilostazols, clopidogrel bisulfates, dipyridamoles, epoprostenols, eptifibatides, tirofiban; colony stimulating factors (CSFs) (including, for example, Granulocyte CSFs and Granulocyte Macrophage CSFs); erythropoiesis
25 stimulators (including, for example, erythropoietins such as darbepoetin alfa) and epoetin alfa; hemostatics and albumins (including, for example, aprotinins, combinations of antihemophilic factors and plasma, Desmopressin Acetates, and albumins); immune globulins, as well as hepatitis B immune globulins; thrombin inhibitors (including for example direct thrombin inhibitors and lepirudin), and
30 drotrecogin alfa; anticoagulants (including, for example, dalteparins, enoxaparin and other heparins, and warfarins).

- 101 -

- Other exemplary therapeutic agents that can be combined by co-administration and/or co-formulation with a soluble PH20, such as an esPH20, include, but are not limited to, Adalimumabs, Agalsidase Betas, Alefacepts, Ampicillins, Anakinras, Antipoliomyelitic Vaccines, Anti-Thymocytes, Azithromycins, Becaplermins,
- 5 Caspofungins, Cefazolins, Cefepimes, Cefotetans, Ceftazidimes, Ceftriaxones, Cetuximabs, Cilastatins, Clavulanic Acids, Clindamycins, Darbepoetin Alfas, Deaclizumabs, Diphtheria, Diphtheria antitoxins, Diphtheria Toxoids, Efalizumabs, Epinephrines, Erythropoietin Alphas, Etanercepts, Filgrastims, Fluconazoles, Follicle-Stimulating Hormones, Follitropin Alphas, Follitropin Betas, Fosphenyloins,
 - 10 Gadodiamides, Gadopentetates, Gatifloxacin, Glatiramers, GM-CSF's, Goserelins, Goserelin acetates, Granisetrons, *Haemophilus Influenza* B's, Haloperidols, Hepatitis vaccines, Hepatitis A Vaccines, Hepatitis B Vaccines, Ibritumomab Tiuxetans, Ibritumomabs, Tiuxetans, Immunoglobulins, Hemophilus influenza vaccines, Influenza Virus Vaccines, Infliximabs, Insulins, Insulin Glargines, Interferons,
 - 15 Interferon alphas, Interferon Betas, Interferon Gammas, Interferon alpha-2a's, Interferon alpha-2b's, Interferon alpha-1's, Interferon alpha-n3's, Interferon Betas, Interferon Beta-1a's, Interferon Gammas, Interferon alpha-consensus, Iodixanols, Iohexols, Iopamidols, Ioversols, Ketorolacs, Laronidases, Levofloxacin, Lidocaines, Linezolid, Lorazepam, Measles Vaccines, Measles virus, Mumps viruses, Measles-
 - 20 Mumps-Rubella Virus Vaccines, Rubella vaccines, Medroxyprogesterones, Meropenems, Methylprednisolones, Midazolams, Morphines, Octreotides, Omalizumabs, Ondansetrons, Palivizumabs, Pantoprazoles, Pegaspargases, Pegfilgrastims, Peg-Interferon Alfa-2a's, Peg-Interferon Alfa-2b's, Pegvisomants, Pertussis vaccines, Piperacillins, Pneumococcal Vaccines and Pneumococcal
 - 25 Conjugate Vaccines, Promethazines, Reteplases, Somatropins, Sulbactams, Sumatriptans, Tazobactams, Tenecteplases, Tetanus Purified Toxoids, Ticarcillins, Tositumomabs, Triamcinolones, Triamcinolone Acetonides, Triamcinolone hexacetonides, Vancomycins, Varicella Zoster immunoglobulins, Varicella vaccines, other vaccines, Alemtuzumabs, Alitretinoin, Allopurinol, Alitretamines,
 - 30 Amifostine, Anastrozole, Arsenic, Arsenic Trioxides, Asparaginase, Bacillus Calmette-Guerin (BCG) vaccines, BCG Live, Bexarotene, Bleomycin, Busulfan,

- 102 -

- Busulfan intravenous, Busulfan orals, Calusterones, Capecitabines, Carboplatins, Carmustines, Carmustines with Polifeprosans, Celecoxibs, Chlorambucils, Cisplatin, Cladribines, Cyclophosphamides, Cytarabines, Cytarabine liposomals, Dacarbazines, Dactinomycins, Daunorubicin liposomals, Daunorubicins, Daunomycins, Denileukin
- 5 Difitoxes, Dexrazoxanes, Docetaxels, Doxorubicins, Doxorubicin liposomals, Dromostanolone propionates, Elliott's B Solutions, Epirubicins, Epoetin alfas, Estramustines, Etoposides, Etoposide phosphates, Etoposide VP-16s, Exemestanes, Floxuridines, Fludarabines, Fluorouracils, 5-Fluorouracils, Fulvestrants, Gemcitabines, Gemtuzumabs, Ozogamicins, Gemtuzumab ozogamicins,
- 10 Hydroxyureas, Idarubicins, Ifosfamides, Imatinib mesylates, Irinotecans, Letrozoles, Leucovorins, Levamisoles, Lomustines, CCNUs, Mechlorethamines, Nitrogen mustards, Megestrols, Megestrol acetates, Melphalans, L-PAMs, Mercaptopurines, 6-Mercaptopurines, Mesnas, Methotrexates, Methoxsalens, Mitomycins, Mitomycin C's, Mitotanes, Mitoxantrones, Nandrolones, Nandrolone Phenpropionates,
- 15 Nofetumomabs, Oprelvekins, Oxaliplatin, Paclitaxels, Pamidronates, Pegademases, Pentostatin, Pipobromans, Plicamycins, Mithramycins, Porfimers, Porfimer sodiums, Procarbazines, Quinacrine, Rasburicase, Rituximabs, Sargramostim, Streptozocin, Talcs, Tamoxifen, Temozolomide, Teniposide, Testolactone, Thioguanine, 6-Thioguanine, Triethylenethiophosphoramide (Thiotepa), Topotecan, Toremifene,
- 20 Trastuzumab, Tretinoin, Uracil Mustards, Valrubicin, Vinblastine, Vincristine, Vinorelbine, Zoledronate, Acivicin, Aclarubicin, Acodazole, Acronine, Adozelesin, Aldesleukin, Retinoic Acid, Alitretinoin, 9-Cis-Retinoic Acid, Alvocidib, Ambazone, Ambomycin, Ametantrone, Aminoglutethimide, Amsacrine, Anaxirone, Ancitabine, Anthramycin, Apaziquone, Argimesna,
- 25 Asperlin, Atrimustine, Azacitidine, Azetepa, Azotomycin, Banoxantrone, Batabulin, Batimastat, Benaxibine, Bendamustine, Benzodepa, Bicalutamide, Bietaserpine, Biricodar, Bisantrone, Bisnafide Dimesylate, Bizelesin, Bortezomib, Brequinar, Bropirimine, Budotitan, Cactinomycin, Canertinib, Caracemide, Carbetimer, Carboquone, Carmofur, Carubicin, Carzelesin,
- 30 Cedefingol, Cemadotin, Chiorambucil, Cioteronel, Cirolemycin, Clanfenur, Clofarabine, Crisnatol, Decitabine, Dexniguldipine, Dexormaplatin,

- 103 -

- Dezaguanines, Diaziquones, Dibrospidiiums, Dienogests, Dinalins, Disermolides, Dofequidars, Doxifluridines, Droloxifenes, Duazomycins, Ecomustines, Edatrexates, Edotecarins, Eflomithines, Elacridars, Elinafides, Elsamitrucins, Emitefurs, Enloplatins, Enpromates, Enzastaurins, Epiropidines, Eptaloprosts, Erbulozoles,
- 5 Esorubicins, Etanidazoles, Etoglucids, Etoprines, Exisulinds, Fadrozoles, Fazarabines, Fenretinides, Fluoxymesterones, Fluocitabines, Fosquidones, Fostricins, Fotretamines, Galarubicins, Galocitabines, Geroquinols, Gimatecans, Gimeracils, Gloxazones, Glufosfamides, Ilmofofines, Ilomastats, Imexons, Improsulfans, Indisulams, Inproquones, Interleukins, Interleukin-2s, recombinant Interleukins,
- 10 Intoplicines, Iobenguanes, Iproplatins, Irsogladines, Ixabepilones, Ketotrexates, L-Alanosines, Lanreotides, Lapatinibs, Ledoxantrones, Leuprolides, Leuprorelins, Lexacalcitols, Liarozoles, Lobaplatins, Lometrexols, Lonafarnibs, Losoxantrones, Lurtotecans, Mafosfamides, Mannosulfans, Marimastats, Masoprocals, Maytansines, Mechioethamines, Melengestrols, Meiphalans, Menogarils, Mepitiostanes,
- 15 Metesinds, Metomidates, Metoprines, Meturedepas, Miboplatins, Miproxifenes, Misonidazoles, Mitindomides, Mitocarcins, Mitocromins, Mitoflaxones, Mitogillins, Mitoguazones, Mitomalcins, Mitonafides, Mitoquidones, Mitospers, Mitozolomides, Mivobulins, Mizoribines, Mofarotenes, Mopidamols, Mubritinibs, Mycophenolic Acids, Nedaplatins, Neizarabines, Nemorubicins, Nitracines, Nocodazoles,
- 20 Nogalamycins, Nolatrexeds, Nortopixantrones, Ormaplatins, Ortataxels, Oteracils, Oxisurans, Oxophenarsines, Patubilones, Peldesines, Peliomycins, Pelitrexols, Pemetrexeds, Pentamustines, Peplomycins, Perfosfamides, Perifosines, Picoplatins, Pinafides, Pipo sulfans, Pirfenidones, Piroxantrones, Pixantrones, Plevitrexeds, Plomestanes, Porfiromycins, Prednimustines, Propamidines, Prospidiiums, Pumitepas,
- 25 Puromycins, Pyrazofurins, Ranimustines, Riboprines, Ritrosulfans, Rogletimides, Roquinimexs, Rufocromomycins, Sabarubicins, Safingols, Satraplatins, Sebriplatins, Semustines, Simtrazenes, Sizofirans, Sobuzoxanes, Sorafenibs, Sparfosates, Sparfosic Acids, Sparsomycins, Spirogermaniums, Spiromustines, Spiroplatins, Squalamines, Streptonigrins, Streptovarycins, Sufosfamides, Sulofenurs, Tacedinalines,
- 30 Talisomycins, Tallimustines, Tariquidars, Tauromustines, Tecogalans, Tegafurs, Teloxantrones, Temoporfin, Teroxirones, Thiamiprines, Tiamiprines, Tiazofurins,

- 104 -

- Tilomisoles, Tilorones, Timcodars, Timonacics, Tirapazamines, Topixantrones, Trabectedins, Ecteinasceidin 743, Trestolones, Triciribines, Trilostanes, Trimetrexates, Triplatin Tetranitrates, Triptorelins, Trofosfarnides, Tubulozoles, Ubenimexs, Uredepas, Vaispodars, Vapreotides, Verteporfin, Vinbiastines, Vindesines,
- 5 Vinepidines, Vinflunines, Vinformides, Vinglycinates, Vinleucinols, Vinleurosines, Vinrosidines, Vintriptols, Vinzolidines, Vorozoles, Xanthomycin A's, Guamecyclines, Zeniplatins, Zilascorbs [2-H], Zinostatins, Zorubicins, Zosuquidars, Acetazolamides, Acyclovirs, Adipiodones, Alatrofloxacin, Alfentanils, Allergenic extracts, Alpha 1-proteinase inhibitors, Aiprostadils, Amikacins, Amino acids, Aminocaproic acids,
- 10 Aminophyllines, Amitriptylines, Amobarbitals, Amrinones, Analgesics, Anti-poliomyelitic vaccines, Anti-rabic serums, Anti-tetanus immunoglobulins, tetanus vaccines, Antithrombin III's, Antivenom serums, Argatroban, Arginines, Ascorbic acids, Atenolols, Atracuriums, Atropines, Aurothioglucoses, Azathiopurines, Aztreonams, Bacitracins, Baclofen, Basiliximab, Benzoic acids, Benzotropines,
- 15 Betamethasones, Biotins, Bivalirudins, Botulism antitoxins, Bretylium, Bumetanide, Bupivacaine, Buprenorphine, Butorphanol, Calcitonin, Calcitriol, Calcium, Capreomycin, Carboprost, Carnitine, Cefamandole, Cefoperazone, Cefotaxime, Cefoxitin, Ceftiofur, Cefuroxime, Chlorthalidone, Chlorpromazine, Chondroitin sulfate, Chloroquine, Chlorothiazide, Chlorthalidone, Chondroitin sulfate, Chlorthalidone,
- 20 Choriogonadotropin alfa, Chromium, Cidofovir, Cimetidine, Ciprofloxacin, Cisatracurium, Clonidine, Codeine, Coicichine, Colistin, Collagen, Corticotropin, Corticotrophin, Cosyntropin, Cyanocobalamin, Cyclosporin, Cysteine, Daclizumab, Dalfopristin, Dalteparin, Danaparoid, Dantrolene, Deferoxamine, Desmopressin, Dexamethasone, Dexmedetomidine,
- 25 Dexpanthenol, Dextran, Iron dextran, Diatrizoic acid, Diazepam, Diazoxide, Dicyclanil, Digoxin, Digoxin, Dihydroergotamine, Diltiazem, Diphenhydramine, Dipyridamol, Dobutamine, Dopamine, Doxapram, Doxercalciferol, Doxycycline, Droperidol, Dyphylline, Edetic acid, Edrophonium, Enalaprilat, Ephedrine, Epoprostenol, Ergocalciferol,
- 30 Ergonovine, Ertapenem, Erythromycin, Esmolol, Estradiol, Estrogen, Ethacrynic acid, Ethanolamine, Ethanol, Ethiodized oil, Etidronic acid,

- 105 -

- Etomidates, Factor VIII's, Famotidines, Fenoldopams, Fentanyl, Flumazenils, Fluoresceins, Fluphenazines, Folic acids, Fomepizoles, Fomivirsens, Fondaparinuxs, Foscarnets, Fosphenytoins, Furosemides, Gadoteridols, Gadoversetamides, Ganciclovirs, Gentamicins, Glucagons, Glucoses, Glycines, Glycopyrrolates,
- 5 Gonadorelins, Gonadotropin chorionics, Haemophilus B polysaccharides, Hemins, Herbals, Histamines, Hydralazines, Hydrocortisones, Hydromorphones, Hydroxocobalamins, Hydroxyzines, Hyoscyamines, Ibutilides, Imiglucerases, Indigo carmines, Indomethacins, Iodides, Iopromides, Iothalamic acids, Ioxaglic acids, Ioxilans, Isoniazids, Isoproterenols, Japanese encephalitis vaccines, Kanamycins,
- 10 Ketamines, Labetalols, Lepirudins, Levobupivacaines, Levothyroxines, Lincomycins, Liothyronines, Luteinising hormones, Lyme disease vaccines, Mangafodipirs, Manthtols, Meningococcal polysaccharide vaccines, Meperidines, Mepivacaines, Mesoridazines, Metaraminols, Methadones, Methocarbamols, Methohexitals, Methyldopates, Methylergonovines, Metoclopramides, Metoprolols, Metronidazoles,
- 15 Minocyclines, Mivacuriums, Morrhuic acids, Moxifloxacin, Muromonab-CD3s, Mycophenolate mofetil, Nafcillins, Nalbuphines, Nalmefenes, Naloxones, Neostigmines, Niacinamides, Nicardipines, Nitroglycerins, Nitroprussides, Norepinephrines, Orphenadrines, Oxacillins, Oxymorphones, Oxytetracyclines, Oxytocins, Pancuroniums, Panthenols, Pantothenic acids, Papaverines, Peginterferon-
- 20 alpha (e.g. interferon alpha 2a or 2b), Penicillin Gs, Pentamidines, Pentazocines, Pentobarbitals, Perfiutrens, Perphenazines, Phenobarbitals, Phentolamines, Phenylephrines, Phenytoins, Physostigmines, Phytonadiones, Polymyxin B, Pralidoximes, Prilocaines, Procainamides, Procaines, Prochlorperazines, Progesterones, Propranolols, Pyridostigmine hydroxides, Pyridoxines, Quinidines,
- 25 Quinupristins, Rabies immunoglobulins, Rabies vaccines, Ranitidines, Remifentanils, Riboflavins, Rifampins, Ropivacaines, Samariums, Scopolamines, Seleniums, Sermorelins, Sincalides, Somatrem, Spectinomycins, Streptokinases, Streptomycins, Succinylcholines, Sufentanils, Sulfamethoxazoles, Tacrolimus, Terbutalines, Teriparatides, Testosterones, Tetanus antitoxins, Tetracaines, Tetradecyl sulfates,
- 30 Theophyllines, Thiamines, Thiethylperazines, Thiopentals, Thyroid stimulating hormones, Tinzaparin, Tirofiban, Tobramycins, Tolazoline, Tolbutamides,

- 106 -

Torsemides, Tranexamic acids, Treprostinils, Trifluoperazines, Trimethobenzamides, Trimethoprim, Tromethamines, Tuberculins, Typhoid vaccines, Urofollitropins, Urokinases, Valproic acids, Vasopressins, Vecuroniums, Verapamils, Voriconazoles, Warfarins, Yellow fever vaccines, Zidovudines, Zincs, Ziprasidone hydrochlorides,

5 Aclacinomycins, Actinomycins, Adriamycins, Azaserines, 6-Azauridines, Carzinophilins, Chromomycins, Denopterin, 6-Diazo-5-Oxo-L-Norleucines, Enocitabines, Loxuridines, Olivomycins, Pirarubicins, Piritrexims, Pteropterins, Tagafurs, Tubercidins, Alteplase, Arcitumomab, bevacizumab, Botulinum Toxin Type A's, Botulinum Toxin Type B's, Capromab Pentetides, Daclizumab, Dornase

10 alfa, Drotrecogin alfa, Imciromab Pentetates, and Iodine-131's.

In particular, therapeutic agents include, but are not limited to, immunoglobulins, Interferon beta, Interferon alpha-2a, Interferon alpha-1s, Interferon alpha-n3s, Interferon beta-1, Interferon beta-1a, Interferon gamma-lb, Peg-interferon alpha-2 and Peginterferon alpha-2b, insulin, a bisphosphate (e.g.

15 Pamidronate or Zoledronate), Docetaxel, Doxorubicin, Doxorubicin liposomal and bevacizumab.

2. Use to Remove Excess Glycosaminoglycanases

Provided herein are methods for treating hyaluronan-associated diseases and conditions by administration of a composition containing a soluble PH20, typically a

20 soluble hyaluronidase either alone or in combination with or in addition to another treatment and/or agent. Hyaluronan-associated conditions and diseases are diseases and conditions in which hyaluronan levels are elevated as cause, consequence or otherwise observed in the disease or condition, and can be treated by administration of a composition hyaluronidases, such as a soluble PH20, either alone or in combination

25 with or in addition to another treatment and/or agent.

Typically, hyaluronan-associated diseases and conditions are associated with elevated hyaluronan expression in a tissue, cell, or body fluid (e.g. tumor tissue or tumor-associated tissue, blood, or interstitial space) compared to a control, e.g. another tissue, cell or body fluid. The elevated hyaluronan expression can be elevated

30 compared to a normal tissue, cell or body fluid, for example, a tissue, cell or body fluid that is analogous to the sample being tested, but isolated from a different subject,

- 107 -

such as a subject that is normal (i.e. does not have a disease or condition, or does not have the type of disease or condition that the subject being tested has), for example, a subject that does not have a hyaluronan-associated disease or condition. The elevated hyaluronan expression can be elevated compared to an analogous tissue from another subject that has a similar disease or condition, but whose disease is not as severe and/or is not hyaluronan-associated or expresses relatively less hyaluronan and thus is hyaluronan-associated to a lesser degree. For example, the subject being tested can be a subject with a hyaluronan-associated cancer, where the HA amounts in the tissue, cell or fluid are relatively elevated compared to a subject having a less severe cancer, such as an early stage, differentiated or other type of cancer. In another example, the cell, tissue or fluid contains elevated levels of hyaluronan compared to a control sample, such as a fluid, tissue, extract (e.g. cellular or nuclear extract), nucleic acid or peptide preparation, cell line, biopsy, standard or other sample, with a known amount or relative amount of HA, such as a sample, for example a tumor cell line, known to express relatively low levels of HA, such as exemplary tumor cell lines described herein that express low levels of HA, for example, the HCT 116 cell line, the HT29 cell line, the NCI H460 cell line, the DU145 cell line, the Capan-1 cell line, and tumors from tumor models generated using such cell lines.

In some cases, hyaluronan-associated diseases and conditions are associated with increased interstitial fluid pressure, decreased vascular volume, and/or increased water content in a tissue, such as a tumor. In one example, treatment with the compositions and compounds provided herein ameliorates one or more of these symptoms or other symptoms associated with the disease or condition, for example, improves survival or quality of life of the subject over time, or inhibits tumor growth.

Exemplary hyaluronan-associated diseases and conditions that can be treated using the provided enzymes, compositions and methods, include, but are not limited to, hyaluronan-rich cancers, for example, tumors, including solid tumors such as late-stage cancers, a metastatic cancers, undifferentiated cancers, ovarian cancer, in situ carcinoma (ISC), squamous cell carcinoma (SCC), prostate cancer, pancreatic cancer, non-small cell lung cancer, breast cancer, colon cancer and other cancers.

- 108 -

Also exemplary of hyaluronan-associated diseases and conditions are diseases that are associated with elevated interstitial fluid pressure, such as diseases associated with disc pressure, and edema, for example, edema caused by organ transplant, stroke, brain trauma or other injury. Exemplary hyaluronan-associated diseases and
5 conditions include diseases and conditions associated with elevated interstitial fluid pressure, decreased vascular volume, and/or increased water content in a tissue, including cancers, disc pressure and edema. In one example, treatment of the hyaluronan-associated condition, disease or disorder includes amelioration, reduction, or other beneficial effect on one or more of increased interstitial fluid pressure (IFP),
10 decreased vascular volume, and increased water content in a tissue.

Typically, the hyaluronan-associated disease or condition is associated with increased HA expression, for example, in a diseased tissue, for example, a tumor. In one example, HALOs (pericellular matrix regions that are rich in proteoglycans, including hyaluronan) form in a tissue of the subject, for example, in a diseased
15 tissue. In another example, the presence of HALOs is detected in an in vitro culture of cells from a tissue of the subject, for example, a diseased tissue.

a. Use in cancer treatment

Hyaluronidase has direct anticarcinogenic effects by degradation of hyaluronic acid in tumors. Thus, soluble PH20 hyaluronidases, such as esPH20, can be used to
20 treat tumors, in particular, tumors that are hyaluronan rich. The hyaluronan-rich cancer can be a cancer in which the cancer cells produce HALOs, cancers that have elevated expression of hyaluronan (as determined by immunostaining, e.g. histological staining of sections from the tumor), cancers that have elevated HAS2 (Hyaluronan synthase 2), cancers that do not produce hyaluronidase (HYAL1) *in*
25 *vitro*. Hyaluronan-rich cancers can be identified by any method for assessing hyaluronan expression, and other known methods for assaying protein/mRNA expression.

Several hyaluronan-rich cancers have been identified. In some cases, hyaluronan expression correlates with poor prognosis, for example, decreased
30 survival rate and/or recurrence-free survival rate, metastases, angiogenesis, cancer cell invasion into other tissues/areas, and other indicators of poor prognosis. Such

- 109 -

correlation has been observed, for example, in hyaluronan-rich tumors including ovarian cancer, SCC, ISC, prostate cancer, lung cancer, including non-small-cell lung cancer (NSCLC), breast cancer, colon cancer and pancreatic cancer (see, for example, Maarit et al., *Cancer Research*, 60:150-155 (2000); Karvinen et al., *British Journal of Dermatology*, 148:86-94 (2003); Lipponen et al., *Eur. Journal of Cancer*, 849-856 (2001); Pirinen et al., *Int. J. Cancer*: 95: 12-17 (2001); Auvinen et al., *American Journal of Pathology*, 156(2):529-536 (2000); Ropponen et al., *Cancer Research*, 58: 342-347 (1998)). Thus, hyaluronan-rich cancers can be treated by administration of a hyaluronidase, such as a soluble PH20, to treat one or more symptoms of the cancer. Hyaluronan-rich tumors include, but are not limited to, prostate, breast, colon, ovarian, stomach, head and neck and other tumors and cancers.

Hyaluronidases can also be used to increase the sensitivity of tumors that are resistant to conventional chemotherapy. For example, a hyaluronidase, such as soluble PH20, can be administered to a patient having a tumor associated with a HYAL1 defect in an amount effective to increase diffusion around the tumor site (e.g., to facilitate circulation and/or concentrations of chemotherapeutic agents in and around the tumor site), inhibit tumor cell motility, such as by hyaluronic acid degradation, and/or to lower the tumor cell apoptosis threshold. This can bring the tumor cell(s) to a state of anoikis, which renders the tumor cell more susceptible to the action of chemotherapeutic agents. Administration of a hyaluronidase can induce responsiveness of previously chemotherapy-resistant tumors of the pancreas, stomach, colon, ovaries, and breast (Baumgartner et al. (1988) *Reg. Cancer Treat.* 1:55-58; Zanker et al. (1986) *Proc. Amer. Assoc. Cancer Res.* 27:390). Thus, in addition to treatment of a cancer with a soluble PH20 alone, the compositions and methods provided herein also can be used to treat hyaluronan-associated cancers by administration of a soluble PH20 in combination with, for example, simultaneously or prior to, a chemotherapeutic or other anti-cancer agent or treatment. In this example, the hyaluronidase, such as a soluble PH20, typically enhances penetration of chemotherapeutic or other anti-cancer agents into solid tumors, thereby treating the disease.

- 110 -

Compositions containing soluble PH20 can be injected intratumorally with anti-cancer agents or intravenously for disseminated cancers or hard to reach tumors. The anticancer agent can be a chemotherapeutic, an antibody, a peptide, or a gene therapy vector, virus or DNA. Additionally, hyaluronidase can be used to recruit
 5 tumor cells into the cycling pool for sensitization in previously chemorefractory tumors that have acquired multiple drug resistance (St Croix et al., (1998) *Cancer Lett* September 131(1): 35-44).

Exemplary anti-cancer agents that can be administered after, coincident with or before administration of a soluble PH20, such as an esPH20, include, but are not
 10 limited to Acivicins; Aclarubicins; Acodazoles; Acronines; Adozelesins; Aldesleukins; Alemtuzumabs; Alitretinoins (9-Cis-Retinoic Acids); Allopurinols; Altretamines; Alvocidibs; Ambazones; Ambomycins; Ametantrones; Amifostines; Aminoglutethimides; Amsacrine; Anastrozoles; Anaxirones; Ancitabines; Anthramycins; Apaziquones; Argimesnas; Arsenic Trioxides; Asparaginases;
 15 Asperlins; Atrimustines; Azacitidines; Azetepas; Azotomycins; Banoxantrones; Batabulins; Batimastats; BCG Live; Benaxibines; Bendamustines; Benzodepas; Bexarotenes; Bevacizumab; Bicalutamides; Bietaserpines; Biricodars; Bisantrones; Bisantrones; Bisnafide Dimesylates; Bizelesins; Bleomycins; Bortezomibs; Brequinars; Bropirimines; Budotitanes; Busulfans; Cactinomycins; Calusterones;
 20 Canertinibs; Capecitabines; Caracemides; Carbetimers; Carboplatins; Carboquones; Carmofurs; Carmustines with Polifeprosans; Carmustines; Carubicins; Carzelesins; Cedefingols; Celecoxibs; Cemadotins; Chlorambucils; Cioterone; Cirolemycins; Cisplatin; Cladribine; Clafenurs; Clofarabine; Crisnatols; Cyclophosphamides; Cytarabine liposomals; Cytarabine; Dacarbazine; Dactinomycins; Darbepoetin
 25 Alfas; Daunorubicin liposomals; Daunorubicins/Daunomycins; Daunorubicins; Decitabine; Denileukin Diftitoxes; Dexniguldipines; Dexonnaplatins; Dexrazoxanes; Dezaguanines; Diaziquones; Dibrospidiums; Dienogests; Dinalins; Disermolides; Docetaxels; Dofequidars; Doxifluridines; Doxorubicin liposomals; Doxorubicin HCL; Docorubicin HCL liposome injection; Doxorubicins; Droloxifenes; Dromostanolone
 30 Propionates; Duazomycins; Ecomustines; Edatrexates; Edotecarins; Eflornithines; Elacridars; Elinafides; Elliott's B Solutions; Elsamitrucins; Emitefurs; Enloplatins;

- 111 -

- Enpromates; Enzastaurins; Epiropidines; Epirubicins; Epoetin alfas; Eptaloprosts; Erbulozoles; Esorubicins; Estramustines; Etanidazoles; Etoglucids; Etoposide phosphates; Etoposide VP-16s; Etoposides; Etoprines; Exemestanes; Exisulinds; Fadrozoles; Fazarabines; Fenretinides; Filgrastims; Floxuridines; Fludarabines;

- (e.g. METHOSARB®); Capecitabines (e.g. XELODA®); Carboplatins (e.g. PARAPLATIN®); Carmustines (e.g. BCNU®, BiCNU®); Carmustines with Polifeprosans (e.g. GLIADEL® Wafer); Celecoxibs (e.g. CELEBREX®); Chlorambucils (e.g. LEUKERAN®); Cisplatin (e.g. PLATINOL®); Cladribines (e.g. LEUSTATIN®, 2-CdA®); Cyclophosphamides (e.g. CYTOXAN®, NEOSAR®);
- 5 Cytarabines (e.g. CYTOSAR-U®); Cytarabine liposomals (e.g. DepoCyt®); Dacarbazines (e.g. DTIC-Domev); Dactinomycins (e.g. COSMEGEN®); Darbepoetin Alfa (e.g. ARANESP®); Daunorubicin liposomals (e.g. DANUOXOME®); Daunorubicins/Daunomycins (e.g. CERUBIDINE®); Denileukin Diftitoxes (e.g. ONTAK®);
- 10 Dexrazoxanes (e.g. ZINECARD®); Docetaxels (e.g. TAXOTERE®); Doxorubicins (e.g. ADRIAMYCIN®, RUBEX®); Doxorubicin liposomals, including Docorubicin HCL liposome injections (e.g. DOXIL®); Dromostanolone propionates (e.g. DROMOSTANOLONE® and MASTERONE® Injection); Elliott's B Solutions (e.g. Elliott's B Solution®); Epirubicins (e.g. ELLENCE®); Epoetin alfa (e.g. EPOGEN®);
- 15 Estramustines (e.g. EMCYT®); Etoposide phosphates (e.g. ETOPOPHOS®); Etoposide VP-16s (e.g. VEPESID®); Exemestanes (e.g. AROMASIN®); Filgrastims (e.g. NEUPOGEN®); Floxuridines (e.g. FUDR®); Fludarabines (e.g. FLUDARA®); Fluorouracils incl. 5-FUs (e.g. ADRUCIL®); Fulvestrants (e.g. FASLODEX®); Gemcitabines (e.g. GEMZAR®);
- 20 Gemtuzumabs/Ozogamicins (e.g. MYLOTARG®); Goserelin acetates (e.g. ZOLADEX®); Hydroxyureas (e.g. HYDREA®); Ibritumomabs/Tiuxetans (e.g. ZEVALIN®); Idarubicins (e.g. IDAMYCIN®); Ifosfamides (e.g. IFEX®); Imatinib mesylates (e.g. GLEEVEC®); Interferon alfa-2a (e.g. ROFERON-A®); Interferon alfa-2b (e.g. INTRON A®); Irinotecans (e.g. CAMPTOSAR®); Letrozoles (e.g. FEMARA®);
- 25 Leucovorins (e.g. WELLCOVORIN®, LEUCOVORIN®); Levamisoles (e.g. ERGAMISOL®); Lomustines/CCNUs (e.g. CeeBU®); Mechlorethamines/Nitrogen mustards (e.g. MUSTARGEN®); Megestrol acetates (e.g. MEGACE®); Melphalans/L-PAMs (e.g. ALKERAN®); Mercaptopurine incl. 6-MPs (e.g. PURINETHOL®); Mesnas (e.g. MESNEX®); Methotrexates;
- 30 Methoxsalens (e.g. UVADEX®); Mitomycin Cs (e.g. MUTAMYCIN®, MITOZYTREX®); Mitotanes (e.g. LYSODREN®); Mitoxantrones (e.g.

- 114 -

NOVANTRONE®); Nandrolone Phenpropionates (e.g. DURABOLIN-50®);
 Nofetumomabs (e.g. VERLUMA®); Oprelvekins (e.g. NEUMEGA®); Oxaliplatins
 (e.g. ELOXATIN®); Paclitaxels (e.g. PAXENE®, TAXOL®); Pamidronates (e.g.
 ARELIA®); Pegademases (e.g. ADAGEN®); Pegaspargases (e.g. ONCASPAR®);
 5 Pegfilgrastims (e.g. NEULASTA®); Pentostatins (e.g. NIPENT®); Pipobromans (e.g.
 VERCYTE®); Plicamycin/Mithramycins (e.g. MITHRACIN®); Porfimer sodiums
 (e.g. PHOTOFRIN®); Procarbazines (e.g. MATULANE®); Quinacrine (e.g.
 ATABRINE®); Rasburicases (e.g. ELITEK®); Rituximabs (e.g. RITUXAN®);
 Sargramostims (e.g. PROKINE®); Streptozocins (e.g. ZANOSAR®); Sunitinib
 10 Malates (e.g. SUTENT®); Talcs (e.g. SCLEROSOL®); Tamoxifens (e.g.
 NOLVADEX®); Temozolomides (e.g. TEMODAR®); Teniposides/VM-26s (e.g.
 VUMON®); Testolactones (e.g. TESLAC®); Thioguanines incl. 6-TG; Thiotepeas
 (e.g. THIOPLEX®); Topotecans (e.g. HYCAMTIN®); Toremifenes (e.g.
 FARESTON®); Tositumomabs (e.g. BEXXAR®); Trastuzumabs (e.g.
 15 HERCEPTIN®); Tretinoin/ATRA (e.g. VESANOID®); Uracil Mustards;
 Valrubicins (e.g. VALSTAR®); Vinblastines (e.g. VELBAN®); Vincristines (e.g.
 ONCOVIN®); Vinorelbines (e.g. NAVELBINE®); and Zoledronates (e.g.
 ZOMETA®).

In one example, a soluble PH20, such as an esPH20, for example, PEGylated
 20 rHuPH20, is administered to a subject after, coincident with or before administration
 of one or more of docetaxel (e.g. TAXOTERE®), Doxorubicin liposomal (e.g.
 DOXIL®), Sunitinib Malate (e.g. SUTENT®) or Bevacizumab (AVASTIN®).

Hence, soluble PH20 polypeptides provided herein can be used in the
 treatment of metastatic and non-metastatic cancers, including those that have
 25 decreased endogenous hyaluronidase activity relative to non-cancerous cells.
 Hyaluronidases can be used as a chemotherapeutic agent alone or in combination
 with other chemotherapeutics. Exemplary cancers include, but are not limited to,
 small lung cell carcinoma, squamous lung cell carcinoma, and cancers of the breast,
 ovaries, head and neck, or any other cancer associated with depressed levels of
 30 hyaluronidase activity or decreased hyaluronic acid catabolism.

- 115 -

b. Use in treatment of glycosaminoglycan accumulation in the brain

Hyaluronic acid levels are elevated in a number of cerebrospinal pathologic conditions. Levels of cerebrospinal hyaluronic acid are normally less than 200 µg/L in adults (Laurent et al. (1996) *Acta Neurol Scand September* 94(3):194-206), but can
5 elevate to levels of over 8000 µg/L in diseases such as meningitis, spinal stenosis, head injury and cerebral infarction. Hyaluronidases, such as, for example, soluble rHuPH20, can be utilized to degrade critically elevated levels of substrate.

The lack of effective lymphatics in the brain also can lead to life threatening
10 edema following head trauma. Hyaluronic acid accumulation is a result of increased synthesis by hyaluronic acid synthases and decreased degradation. Accumulation of hyaluronic acid can initially serve the beneficial purpose of increasing water content in the damaged tissue to facilitate leukocyte extravasation, but continued accumulation can be lethal. Administration of hyaluronidase, such as intrathecally or
15 intravenously, to a patient suffering from head trauma can serve to remove tissue hyaluronic acid accumulation and the water associated with it.

Soluble PH20 also can be used in the treatment of edema associated with brain tumors, particularly that associated with glioblastoma multiform. The edema associated with brain tumors results from the accumulation of hyaluronic acid in the
20 non-cancerous portions of the brain adjacent the tumor. Administration of a soluble PH20 hyaluronidase to the sites of hyaluronic acid accumulation (e.g., by intravenous injection or via a shunt) can relieve the edema associated with such malignancies by degrading the excess hyaluronic acid at these sites.

**c. Use in treatment of glycosaminoglycan accumulation in
25 cardiovascular disease**

Soluble PH20 hyaluronidases can be used in the treatment of some cardiovascular disease. Administration of hyaluronidase in animal models following experimental myocardial infarct can reduce infarct size (Maclean, et al (1976) *Science* 194(4261):199-200). One proposed mechanism by which this can occur is by
30 reducing hyaluronic acid accumulation that occurs following ischemia reperfusion.

- 116 -

Reduction of infarct size is believed to occur from increased lymph drainage and increased tissue oxygenation and reduction of myocardial water content.

Soluble PH20 hyaluronidases also can be used to limit coronary plaques from arteriosclerosis. Such plaques accumulate glycosaminoglycans and mediate
5 macrophage and foam cell adhesion (Kolodgie et al. (2002) *Arterioscler Thromb Vasc Biol.* 22(10):1642-8).

d. Use in vitrectomy and ophthalmic disorders and conditions

Hyaluronidase, such as a soluble PH20, can be used to minimize the detachment or tearing of the retina during vitrectomy. This could cause, for example,
10 the vitreous body to become uncoupled or “disinserted” from the retina, prior to removal of the vitreous body. Such disinsertion or uncoupling of the vitreous body can minimize the likelihood that further tearing or detachment of the retina will occur as the vitreous body is removed.

Hyaluronidase, such as a soluble PH20, can be used for various ophthalmic
15 applications, including the vitrectomy adjunct application described in U.S. Pat. No. 5,292,509. The use of a highly purified hyaluronidase, such as, for example, soluble PH20 provided herein, is preferable for intraocular procedures to minimize immunogenicity and toxicity.

Soluble PH20 hyaluronidases can be used to treat and/or prevent ophthalmic
20 disorders by, for example, preventing neovascularization and increasing the rate of clearance from the vitreous of materials toxic to the retina. A soluble PH20 hyaluronidase can be administered in an amount effective to liquefy the vitreous humor of the eye without causing toxic damage to the eye. Liquefaction of the vitreous humor increases the rate of liquid exchange from the vitreal chamber. This
25 increase in exchange removes the contaminating materials whose presence can cause ophthalmologic and retinal damage.

Soluble PH20 hyaluronidases also can be used to reduce postoperative pressure. Hyaluronic acid has been used in eye primarily as a spacer during cataract and intraocular lens surgical procedures. It also is used in other ocular surgical
30 procedures such as glaucoma, vitreous and retina surgery and in corneal transplantation. A common side effect occurring in postoperative cataract patients is a

- 117 -

significant early, and occasionally prolonged, rise in intraocular pressure. Such a condition is sometimes serious, especially in patients with glaucomatous optic disc changes. Hyaluronidase, such as soluble PH20, can be co-administered with hyaluronic acid to the eye prior to surgery to reduce postoperative pressure in the eye.

- 5 The hyaluronidase is administered in an amount effective to reduce the intraocular pressure to pre-operative levels by breaking down the hyaluronic acid without decreasing its effectiveness during surgery nor causing side effects in the patient (U.S. Patent No. 6,745,776).

- 10 Soluble PH20 hyaluronidases also can be administered to patients with glaucoma to remove glycosaminoglycans from the trabecular meshwork and reduce intraocular pressure, and can be applied to the vitreous to promote the resolution of vitreous hemorrhages (i.e. extravasation of blood into the vitreous), which can occur in connection with conditions such as diabetic retinopathy, retinal neovascularization, retinal vein occlusion, posterior vitreous detachment, retinal tears, ocular traumas and
- 15 the like. The presence of vitreous hemorrhages, which are typically slow to resolve, can delay, complicate or prevent procedures that require the retina to be visualized through the vitreous for diagnosis and/or for treatment procedures such as laser photocoagulation and the like which are often primary treatments for conditions such as proliferative diabetic retinopathy.

20 e. Use in hypodermoclysis

- Hypodermoclysis, the infusion of fluids and electrolytes into the hypodermis of the skin, is a useful and simple hydration technique suitable for mildly to moderately dehydrated adult patients, especially the elderly. Although considered safe and effective, the most frequent adverse effect is mild subcutaneous edema that
- 25 can be treated by local massage or systemic diuretics. Approximately 3 L can be given in a 24-hour period at two separate sites. Common infusion sites include the chest, abdomen, thighs and upper arms. Solutions used in hypodermoclysis include, for example, normal saline, half-normal saline, glucose with saline and 5% glucose. Potassium chloride also can be added to the solution. The addition of a hyaluronidase,
- 30 such as a soluble PH20, to the solution can enhance fluid absorption and increase the overall rate of administration.

- 118 -

f. Use in gene therapy

The efficacy of most gene delivery vehicles *in vivo* does not correspond to the efficacy found observed *in vitro*. Glycosaminoglycans can hinder the transfer and diffusion of DNA and viral vectors into many cell types. The levels such extracellular matrix material can hinder the process considerably. Administration of hyaluronidase, such as a soluble PH20, can open channels in the extracellular matrix, thus enhancing delivery of gene therapy. For example, soluble PH20 can be administered with collagenase to facilitate transduction of DNA *in vivo* (Dubensky et al. (1984) *Proc Natl Acad Sci USA* 81(23):7529-33). Hyaluronidase also can enhance gene therapy using adeno-associated virus (Favre et al, (2000) *Gene Therapy* 7(16):1417-20). The channels opened following administration of hyaluronidase are of a size that typically enhance diffusion of smaller molecules such as retroviruses, adenoviruses, adeno-associated viruses and DNA complexes (as well as other therapeutic and pharmacological agents of interest). The pores are not so large, however, as to promote the dislocation and movement of cells.

In some examples, viruses can be engineered to express hyaluronidase, such as a soluble PH20, to facilitate their replication and spread within a target tissue. The target tissue can be, for example, a cancerous tissue whereby the virus is capable of selective replication within the tumor. The virus also can be a non-lytic virus wherein the virus selectively replicates under a tissue specific promoter. As the viruses replicate, the co-expression of hyaluronidase with viral genes can facilitate the spread of the virus *in vivo*.

g. Cosmetic uses

Hyaluronidases, such as a soluble PH20, can be by administered to remove glycosaminoglycans involved in the accumulation of cellulite and to promote lymphatic flow. For example, soluble PH20 can be used for the treatment of cellulite. The hyaluronidase can be administered through repeated subcutaneous injections, through transdermal delivery in the form of ointments or creams or through the use of injectable slow release formulations to promote the continual degradation of glycosaminoglycans and prevent their return.

- 119 -

Hyaluronidase, such as a soluble PH20, also can be used to treat conditions such as "pigskin" edema or "orange peel" edema. Hyaluronidases can effect depolymerization of the long mucopolysaccharide chains that can accumulate in the dermis and which are responsible for the retention of bound water and of the slowing, by capillary compression, of the diffusion of organic liquids, which eliminate metabolic wastes. Such retention of water and wastes associated with fat overloading of the lipocytes, constitutes classical "pigskin" edema or "orange peel" edema. Depolymerization can cut the long chains of mucopolysaccharides into shorter chains, resulting in the elimination of the bound water and wastes and restoration of the venous and lymphatic circulation, culminating in the disappearance of local edema.

h. Use in organ transplantation

The content of hyaluronic acid in an organ can increase with inflammation. An increased concentration of hyaluronic acid has been observed in tissue from different organs characterized by inflammatory-immunological injury such as alveolitis (Nettelbladt et al. (1991) *Am. Rev. Resp. Dis.* 139: 759-762) and myocardial infarction (Waldenstrom et al. (1991) *J. Clin. Invest.* 88(5): 1622-1628). Other examples include allograft rejection after a renal (Hallgren et al. (1990) *J. Exp. Med.* 171: 2063-2076; Wells et al. (1990) *Transplantation* 50: 240-243), small bowel (Wallander et al. (1993) *Transplant. Int.* 6: 133-137) or cardiac (Hallgren et al. (1990) *J Clin Invest* 85:668-673) transplantation; or a myocardial inflammation of viral origin (Waldenstrom et al. (1993) *Eur. J. Clin. Invest.* 23: 277-282). The occurrence of interstitial edemas in connection with the grafting of an organ constitutes a severe problem in the field of transplantation surgery. Grafts with interstitial edemas can swell to such a degree that the function is temporarily be lost. In some instances, the swelling can cause disruption of the kidney, resulting in a massive hemorrhage. Hyaluronidases, such as a soluble PH20, can be used to degrade accumulated glycosaminoglycans in an organ transplant. Removal of such glycosaminoglycans promotes removal of water from the graft and thus enhances organ function.

i. Use in pulmonary disease

Levels of hyaluronic acid in bronchoalveolar lavages (BAL) from normal individuals are generally below 15 ng/ml. Hyaluronic acid levels in BAL rise

- 120 -

dramatically in conditions of respiratory distress (Bjermer et al.(1987) *Br Med J (Clin Res Ed)* 295(6602):803-6). The increased hyaluronic acid in the lung can prevent oxygen diffusion and gas exchange as well as activating neutrophil and macrophage responses. Purified preparations of soluble PH20, such as any provided herein, can be delivered by either pulmonary or intravenous delivery to patients presenting with such conditions to reduce hyaluronan levels. Hyaluronidases, such as a soluble PH20, also can be administered to patients suffering from other pulmonary complications that are associated with elevated glycosaminoglycans or to enhance the delivery of other co delivered molecules to the lung.

10 **3. Other uses**

In further examples of its therapeutic use, hyaluronidase, such as a soluble PH20 including esPH20 provided herein, can be used for such purposes as an antidote to local necrosis from paravenous injection of necrotic substances such as vinka alkaloids (Few et al. (1987) *Amer. J. Matern. Child Nurs.* 12, 23-26), treatment of ganglion cysts (Paul et al. (1997) *J Hand Surg.* 22 (2): 219-21) and treatment of tissue necrosis due to venous insufficiency (Elder et al. (1980) *Lancet* 648-649). Soluble PH20 also can be used to treat ganglion cysts (also known as a wrist cyst, Bible cyst, or dorsal tendon cyst), which are the most common soft tissue mass of the hand and are fluid filled sacs that can be felt below the skin.

20 Hyaluronidases, such as soluble PH20, can be used in the treatment of spinal cord injury by degrading chondroitin sulfate proteoglycans (CSPGs). Following spinal cord injury, glial scars containing CSPGs are produced by astrocytes. CSPGs play a crucial role in the inhibition of axon growth. In addition, the expression of CSPG has been shown to increase following injury of the central nervous system (CNS).

25 Soluble PH20 also can be utilized for the treatment of herniated disks in a process known as chemonucleolysis. Chondroitinase ABC, an enzyme cleaving similar substrates as hyaluronidase, can induce the reduction of intradiscal pressure in the lumbar spine. There are three types of disk injuries. A protruded disk is one that is intact but bulging. In an extruded disk, the fibrous wrapper has torn and the NP has oozed out, but is still connected to the disk. In a sequestered disk, a fragment of the NP has broken loose from the disk and is free in the spinal canal. Chemonucleolysis is

30

- 121 -

typically effective on protruded and extruded disks, but not on sequestered disk injuries.

I. Examples

The following examples are included for illustrative purposes only and are not intended to limit the scope of the invention.

Example 1

Generation of Human PH20 Hyaluronidase Carboxy-terminus Deletion Mutants

In this example, a series of human PH20 hyaluronidase carboxy-terminus deletion mutants were generated. Mature human PH20 hyaluronidase, or sperm adhesion molecule 1 (SPAM1), contains 474 amino acids while the mature carboxy-terminus deletion mutants generated in this example ranged in length from 472 amino acids to 415 amino acids.

DNA oligonucleotides encoding truncated human PH20 hyaluronidase carboxy-terminus deletion mutants from amino acid A507 to amino acid K450 were synthesized according to standard DNA synthesis protocols. The parent DNA sequence was a codon-optimized human PH20 hyaluronidase, the nucleotide sequence of which is set forth in SEQ ID NO:2. This codon-optimized human PH20 hyaluronidase contained an heterologous immunoglobulin kappa (IgK) signal sequence, set forth in SEQ ID NO:144. Additionally, the sequences contained a 5' NheI and a 3' BamHI restriction site to allow cloning into the HZ24 plasmid (SEQ ID NO:140). The human PH20 hyaluronidase carboxy-terminus deletion mutant nucleotide sequences are set forth in SEQ ID NOS:146-185 and 199-201. The synthetic DNA sequences were digested with NheI and BamHI restriction enzymes and cloned into a similarly digested HZ24 plasmid to generate a mutant SPAM1-HZ24 plasmid for each individual clone.

The human PH20 hyaluronidase carboxy-terminus deletion mutants are set forth in Table 3. The SPAM1 mutants are identified by the 4 amino acids at the C-terminal end of the proteins. Also set forth are the length, in amino acids, of the precursor and mature carboxy-terminus deletion mutants.

Table 3. Human PH20 hyaluronidase carboxy-terminus deletion mutants.

Example 2**Expression of Human PH20 Hyaluronidase Carboxy-terminus Deletion Mutants**

In this example, the human PH20 hyaluronidase carboxy-terminus deletion mutants generated in Example 1 were expressed in CHO-S cells. Additionally, 5 rHuPH20 and His-tagged PH20 were expressed in each of four strains of lectin resistant CHO mutants, including Lec1 (Cat No. CRL-1735, ATCC), Lec2 (Cat No. CRL-1736, ATCC), Lec8 (Cat No. CRL-1737, ATCC) and Pro-5 (Cat No. CRL-1781). The expression of PH20 in Lec mutant cells is further discussed in Example 9 below.

10 A. Transient Expression in CHO-S Cells in 6-well plates

The mutant PH20-HZ24 plasmids generated in Example 1 were transiently infected into CHO-S cells (derived from Chinese Hamster Ovary CHO K1 cells) using GeneJuice® (Novagen) according to the manufacturer's instructions. In short, the CHO-S cells were grown in CD CHO medium supplemented with L-glutamine. 15 Prior to transfection, the CHO-S cells were plated in 6-well plates, with approximately 5×10^5 cells per well, and grown overnight at 37 °C with 5 % CO₂. The medium was then removed and the CHO-S cells were washed 2 times with 1 mL serum-free medium. GeneJuice® was mixed with serum-free media followed by the addition of 2 µg mutant-HZ24 DNA. After incubating at room temperature for 5-15 20 minutes, the GeneJuice®/DNA mixture was added dropwise to an individual well containing the washed CHO-S cells. After 4 hours, the medium was replaced with 1 mL CD-CHO medium supplemented with L-glutamine and the cells were incubated for 72 hours at 37 °C with 5 % CO₂. Following expression, the media and cells were harvested separately.

25 B. Transient Expression in CHO Cells in 10 cm cell culture dishes

The mutant PH20-HZ24 plasmids generated in Example 1 were transiently infected into CHO-S cells using GeneJuice® (Novagen) according to the manufacturer's instructions. Alternatively, HZ24-PH20, (SEQ ID NO:108, encoding rHuPH20), PH20sHis, (SEQ ID NO:187, encoding his-tagged PH20) and HZ24- 30 mut(B/S) (SEQ ID NO:122, encoding PH20 truncated at amino acid 482), were transiently infected into four strains of lectin resistant CHO mutants, including Lec1 (Cat No. CRL-1735, ATCC), Lec2 (Cat No. CRL-1736, ATCC), Lec8 (Cat No. CRL-

- 124 -

1737, ATCC) and Pro-5 (Cat No. CRL-1781), using GeneJuice® (Novagen) according to the manufacturer's instructions.

In short, CHO-S cells were maintained in CD-CHO medium supplemented with 8 mM GlutaMax. Lectin resistant CHO mutant cells were grown in DMEM medium supplemented with 10% FBS. Prior to transfection, the CHO cells were plated in 10 cm cell culture dishes, with approximately 3×10^6 cells per well and grown overnight in DMEM medium supplemented with 10% FBS at 37 °C with 5 % CO₂. The medium was then removed and the monolayer of cells was washed 2 times with 10 mL serum-free medium. 36 µL GeneJuice® was mixed with 1.2 mL DMEM and incubated at room temperature for 5 minutes. Following incubation, 12 µg DNA was added and mixed gently. After incubating at room temperature for 15 minutes, the GeneJuice®/DNA mixture was added dropwise to the monolayer of CHO cells and the cell culture dish was shaken gently to allow for mixing. The plate was incubated for 4 hours at 37 °C with 5 % CO₂. After 4 hours, the medium was replaced with 12 mL detergent free CD DG44 medium supplemented with Glutamax-1 and the cells were incubated for 48 hours at 37 °C with 5 % CO₂. Following expression, the media and cells were harvested separately.

Example 3

Solubility of Human PH20 Hyaluronidase Carboxy-terminus Deletion Mutants

In this example, following transient expression, as described in Example 2 above, the media and cells were harvested separately and analyzed for PH20 expression and solubility by Western blot analysis. Solubility of the C-terminus truncation mutants was determined by examining whether the expressed protein was present in the growth media or in the cells. C-terminus deletion mutants from 455 to 472 amino acids in length, corresponding to SEQ ID NOS:55-65 and 99-101, contain amino acid residues from the GPI-anchor which serves to attach the protein to the cell membrane. Cells expressing these mutants were treated with phosphoinositol-phospholipase C (PI-PLC), which cleaves the GPI-anchor allowing the release of soluble protein into the media, and the presence of PH20 in the resulting media and cells was determined by Western blot analysis.

- 125 -

A. Western blot analysis

Non-reduced samples were run on a 4-20% Tris-Glycine gel and transferred to PVDF membrane using iBlot (Invitrogen). For the Western blot, rabbit anti-PH20 IgG (0.5 µg/mL) was used as the primary antibody and HRP-conjugated goat anti-rabbit IgG (0.1 ng/mL, Cat# DC03L, EMD) was used as the secondary antibody. Evidence of expression is determined by a band at approximately 66 kDa, corresponding to recombinant human PH20 hyaluronidase.

B. PI-PLC Treatment**1. Transient Expression in 6-well plates**

Following expression of rHuPH20 in CHO-S cells for 72 hours, as described in Example 2A above, the media and cells were harvested separately. The cells were washed with serum-free media followed by the addition of 2 mL serum-free media per well. PI-PLC (0.5 units/well) was added to each well and the cells were incubated in the PI-PLC for 2 hours. The resultant media and cells were analyzed by Western blot analysis as described above.

2. Transient Expression in 10 cm tissue culture dishes

Two plates each of rHuPH20 expressing CHO-S cells, one for treatment with PI-PLC and one without treatment with PI-PLC, were prepared for each C-terminus mutant as described in Example 2B above. Following expression for 48 hours, for cells untreated with PI-PLC, the media and cells were harvested separately. The harvested media was spun down, concentrated to a volume of 10 mL, and buffer exchanged into PBS using an Amicon 30kD MWCO concentrator. The cells were rinsed with cold PBS and scraped and resuspended in 1.2 mL PBS with protease inhibitor Set III (Cat No. 539134, Calbiochem). The resuspended cells were briefly sonicated to prepare whole-cell extract. For PI-PLC treatment of cells, following expression for 48 hours, the untreated media was harvested, as described above. The cells were rinsed once with fresh CD DG44 medium with Glutamax-1, and the media was replaced with 12 mL fresh detergent free CD DG44 medium supplemented with Glutamax-1 with 3.0 units PI-PLC per dish, and the cells were incubated for 2 hours at 37 °C with 5 % CO₂. After 2 hours, the PI-PLC media and cells were harvested

- 126 -

separately, as described above. The resultant untreated media and cells, and PI-PLC treated media and cells, were analyzed by Western blot analysis as described above.

C. Results

The results are described in Table 4 below. Four mutants, ILFL (SEQ ID NO:58), SILF (SEQ ID NO:100), VSIL (SEQ ID NO:59) and IVSI (SEQ ID NO:101), exhibited low expression of PH20. Western blot analysis shows that human PH20 hyaluronidase carboxy-terminus deletion mutants shorter than F500 (SEQ ID NOS:59-95 and 100-101) are expressed in the media, as evidenced by a protein band at approximately 66 kDa. Human PH20 hyaluronidase carboxy-terminus deletion mutants with lengths between L501 and A507 (SEQ ID NOS:55-58 and 99) are expressed in the cells. Upon treatment of these cells with PI-PLC, human PH20 hyaluronidase is released into the media, as evidenced by a protein band at approximately 66 kDa. Treatment of cells from human PH20 hyaluronidase carboxy-terminus deletion mutants, corresponding to SEQ ID NOS:59-65 and 100-101, with PI-PLC had no effect since these proteins were initially expressed into the media.

Table 4. Human PH20 hyaluronidase carboxy-terminus deletion mutant expression.

Example 4

Solubility of Human PH20 Hyaluronidase Carboxy-terminus Deletion Mutants using Triton® X-114 Assay

5 In this example, the solubility of the human PH20 hyaluronidase carboxy-terminus deletion mutants was tested using a Triton® X-114 assay. In this assay, soluble PH20 hyaluronidases will partition into the aqueous phase of a Triton® X-114 solution warmed to 37 °C (modification as described by Bordier et al., (1981) *J. Biol. Chem.*, 256:1604-7) while membrane-anchored PH20 hyaluronidases will

10 partition into the detergent rich phase.

For this purpose, 2% (v/v) Triton® X-114 in PBS at 0 °C was added to 200 µL of tissue culture media or cell extract, as prepared in Example 3B above, and the samples were incubated on ice. For separation, the sample was overlaid on a 30 µL sucrose cushion (6% w/v) containing 0.06% Triton® X-114 at 4 °C in a microfuge

- 129 -

tube. The samples were heated to 37 °C for 3 minutes to induce phase separation and centrifuged for 3 min at 4000g at room temperature. Aqueous and detergent phases were removed for SDS-PAGE analysis and Western blotting. Rabbit anti-PH20 IgG (0.5 µg/mL) was used as the primary antibody and HRP-conjugated goat anti-Rabbit IgG (0.1 ng/mL, Cat# DC03L, EMD) was used as the secondary antibody. Full length human PH20, which partitions strongly into the detergent phase, was used as a control.

The results of the solubility of the carboxy-terminus deletion mutants are shown in Table 5. Human PH20 hyaluronidase carboxy-terminus deletion mutants up to F500 (precursor SEQ ID NOS:7-13 and 48-49 or mature SEQ ID NOS:59-65 and 100-101) partition into the aqueous phase and are therefore soluble. Human PH20 hyaluronidase carboxy-terminus deletion mutants longer than F500 (SEQ ID NOS:55-58 and 99) partition into the detergent phase and are insoluble. Full length PH20 is also insoluble.

Example 5

Hyaluronidase Activity of Human PH20 Hyaluronidase Carboxy-terminus Deletion Mutants

In this example, the human PH20 hyaluronidase carboxy-terminus deletion mutants were tested for their PH20 hyaluronidase activity using a microtiter assay

- 130 -

with biotinylated-hyaluronic acid (biotinylated-HA or bHA). The human PH20 hyaluronidase carboxy-terminus deletion mutants were tested for hyaluronidase activity at both pH 7.4 and pH 5.5.

In short, a 4xBHX 96-well plate was coated with biotinylated-HA (1.1 MDa).
 5 The 72 hour post transfection supernatant from cells transfected with human PH20 hyaluronidase carboxy-terminus deletion mutants was diluted in buffer at either pH 7.4 or pH 5.5 and added to individual wells of the plate and allowed to incubate at 37 °C for 90 minutes. The reaction was terminated by addition of 4M guanidine HCl. The wells were washed 4x with Phosphate Buffered Saline with Tween20 (PBST) to
 10 remove any digested biotinylated-HA followed by addition of streptavidin-HRP for 1 hour at room temperature. The wells were washed 4x with PBST and the plate was developed with TMB. The plate was read at 450 nm using an ELISA plate reader. Hyaluronidase activity (in Units/mL) was determined by interpolating the measured absorbance at 450 nm with a hyaluronidase reference standard curve. Full length
 15 mature human PH20 hyaluronidase and untransfected CHO cells were used as positive and negative controls.

The results are shown in Tables 6 and 6A, below. Human PH20 hyaluronidase carboxy-terminus deletion mutants shorter than I430, corresponding to SPAM1-GDVC to SPAM1-ADVК (SEQ ID NOS:88-95), are inactive. Human PH20
 20 hyaluronidase carboxy-terminus deletion mutants ending at I498 (SEQ ID NO:101), L499 (SEQ ID NO:59), F500 (SEQ ID NO:100), L501 (SEQ ID NO:58) and I502 (SEQ ID NO:99) have little detectable activity due to low expression level. All other human PH20 hyaluronidase carboxy-terminus deletion mutants (SEQ ID NOS:55-57 and 60-87) are active hyaluronidases at both pH 7.4 and pH 5.5.

Example 6

Glycan Analysis of rHuPH20 by LC-MS

In this example, a glycan analysis study of rHuPH20 (SEQ ID NO:122) was
5 performed by mass spectral analysis of trypsin digested PH20.

Briefly, rHuPH20 (as produced in Example 15C), was lyophilized and
resuspended in buffer containing 6M guanidine HCL, 0.002 M EDTA and 0.02 M
Tris, pH 8.28 to a final concentration of 0.5 mg/mL. DTT (10 mM final
concentration) was added and the protein/DTT mixture was incubated for 1 hour at 37
10 °C. Following reduction, iodoacetamide was added to a final concentration of 20
mM. Finally, trypsin (1:25 w/w) was added and the mixture was incubated for 20
hours at 37 °C.

The tryptic digests were analyzed by LC-MS. Briefly, the tryptic digests were
injected onto a C18 reverse phase column using the conditions set forth in Table 7
15 below. MS data was collected on a Q-TOF Ultima mass spectrometer using

- 134 -

electrospray ionization (ESI) in positive ion mode. Data was acquired from m/z 200-1950 in MS mode. The glycopeptides were analyzed using GlycoMod software (www.expasy.ch/tools/glycomod/) to determine the glycan type.

Run Time (total)	180 minutes		

- 5 Human PH20 hyaluronidase has one O-glycosylation site at T475. The site is occupied by a core type 1 glycan that has one or two sialic acids. rHuPH20 is glycosylated at six different asparagine residues, including N82, N166, N235, N254, N368, and N393. The results show that N254 is approximately 75% occupied, N393 is approximately 85% occupied, and the four remaining sites, N82, N166, N235 and
- 10 N368, are greater than 99% occupied. All of the three types of N-glycans, high mannose, hybrid and complex types, are present in rHuPH20. In general, rHuPH20 contains about 45% high mannose glycans, 45% complex glycans and 10% hybrid glycans. About 35% of the total glycans are anionic, of which 25% contain a sialic acid and the remaining 10% contain an unknown anionic group, possibly a phosphate
- 15 group. Most of the complex glycans are fucosylated and the anionic complex glycans contain mostly one sialic acid while a few of them contain two sialic acids. Each asparagine residue has about 90% of one type of glycan and a small proportion of the other two types of glycans, with the exception of N235. The major glycan type for each residue is set forth in Table 8 below. Residues N82, N166 and N254 are
- 20 occupied by complex glycans. Residues N368 and N393 are occupied by high

- 135 -

mannose glycans. Residue N235 is occupied by approximately 80% high mannose glycans, with approximately 20% complex glycans.

Table 8. Types of N-glycans at asparagine residues in rHuPH20		
Glycan Site	High Mannose glycans	Complex Glycans
N82		X
N166		X
N235	~ 80%	~ 20%
N254		X
N368	X	
N393	X	

Example 7

5 **Deglycosylation of Human PH20 Hyaluronidase by treatment with Endoglycosidases**

In this example, human PH20 hyaluronidase was deglycosylated by treatment of purified rHuPH20 (SEQ ID NO:122) with various glycosidases and hyaluronidase activity was assessed. Human PH20 hyaluronidase is glycosylated at six different asparagine residues, including N82, N166, N235, N254, N368, and N393. Five glycosidases were used to generate deglycosylated human PH20 hyaluronidase, including: PNGaseF (New England Biolabs, Cat. No. P0704S, Lot #34), which cleaves all N-glycans; EndoF1, which cleaves high mannose and hybrid type glycans; EndoF2, which cleaves biantennary complex type glycans; EndoF3, which cleaves biantennary and more branched complex glycans; and EndoH (New England Biolabs, Cat. No. P0702S), which cleaves high mannose and hybrid type glycans. Therefore, treatment with PNGaseF results in complete deglycosylation whereas treatment with endoglycosidases results in only partial deglycosylation.

For complete deglycosylation, purified rHuPH20 (0.1 mg/mL final concentration) was incubated with PNGaseF (50,000 units/mL) in 50 mM phosphate buffer pH 7.2 overnight at 37 °C. For partial deglycosylation, purified rHuPH20 (0.5 mg/mL final concentration) was incubated with 0.3 units/mL of endoglycosidase (either EndoF1, EndoF2, EndoF3 or EndoH) or a mixture all four endoglycosidases in 50 mM sodium acetate buffer pH 5.0 overnight at 35 °C. Deglycosylation of rHuPH20 was analyzed by the shift in the mobility of PH20 by SDS-PAGE. Hyaluronidase enzymatic activity was determined as described in Example 5.

- 136 -

Human PH20 hyaluronidase has a molecular weight of approximately 66 kDa. Treatment with EndoF1, EndoH or a mixture of EndoF1, EndoF2, EndoF3 and EndoH resulted in partially deglycosylated human PH20 hyaluronidase as determined by SDS-PAGE mobility shift to a molecular weight of approximately 56 kDa.

- 5 Treatment with PNGaseF resulted in complete deglycosylation of human PH20 hyaluronidase. Partial deglycosylation of rHuPH20 did not result in inactivation of hyaluronidase enzymatic activity whereas exhaustive digestion with PNGaseF to completely remove N-glycans resulted in the total loss of hyaluronidase enzymatic activity (see Table 9 below).

Table 9. Effect of glycosidase treatment on rHuPH20 activity							
rHuPH20 (U/ml)	Control PH20	EndoF1	EndoF2	EndoF3	EndoH	EndoF1, F2,F3,H	PNGaseF

Example 8

Treatment of Human PH20 Hyaluronidase with Glycosylation inhibitors

In this example, rHuPH20 (SEQ ID NO:122) was transiently expressed in the presence of each of two glycosylation inhibitors and hyaluronidase secretion and activity were assessed. Kifunensine is a potent inhibitor mannosidase I, an enzyme involved in glycan processing (see e.g., Elbein et al., *J Biol Chem*, 265:15599-15605 (1990)). Tunicamycin is a mixture of homologous nucleoside antibiotics that inhibit the enzyme GlcNAc phospho-transferase (GPT), thereby blocking the synthesis of all N-glycans (see e.g., Böhme et al., *Eur. J. Biochem.* 269:977-988 (2002)).

- 20 Briefly, 1×10^6 HZ24-2B2 cells expressing rHuPH20 (see Example 14 below) were seeded in 24 mL complete CD-CHO medium in two 125 mL flasks. Tunicamycin (dissolved in DMSO) or Kifunensine (freshly dissolved in water) was added to a final concentration of 5 $\mu\text{g/mL}$ (containing 12 μL DMSO). As a control, one flask was seeded with 1×10^6 HZ24-2B2 cells expressing rHuPH20 and 12 μL DMSO was added as a vehicle control. Following addition of either tunicamycin or kifunensine, the cells were incubated for 4-6 hours at 37 °C with 5% CO₂. Following expression, a 2 mL culture was removed and centrifuged for 5 minutes at 500g. The
- 25

- 137 -

supernatant was stored at 4 °C and the cell pellets were stored at -20 °C. The remaining 22 mL cultures were centrifuged for 5 minutes at 500g. The supernatant was stored at 4 °C. The cells were resuspended in 22 mL complete CD-CHO medium in the original two 125 mL flasks. Tunicamycin or Kifunensine was added to the culture at a final concentration of 5 µg/mL and the cells were incubated at 37 °C with 5% CO₂. Two mL (2 mL) cultures were removed from each flask at approximately every 24 hours post changing medium. For each time point, the supernatant was stored at 4 °C and the cell pellets were stored at -20 °C. The expression of rHuPH20 was analyzed by Western blot analysis and the hyaluronidase activity was measured using the biotinylated HA enzymatic assay (as described in Examples 3 and 5 above).

The results are shown in Tables 10-13 below, which set forth the number of viable cells and the PH20 activity. As shown in Tables 10-11, tunicamycin inhibits PH20 activity in both tissue culture media and inside the cell and also results in a complete loss of cell viability. Additionally, one hour of treatment with tunicamycin resulted in the accumulation of deglycosylated human PH20 hyaluronidase inside the cell, as determined by SDS-PAGE mobility shift to a molecular weight of approximately 56 kDa in the cell pellet fractions. As shown in Tables 12-13, kifunensine did not affect the activity of PH20 while western blot analysis revealed kifunensine inhibited the expression and secretion of rHuPH20 in treated cells.

Example 9**5 Transient Expression of rHuPH20 in Lectin resistant CHO mutants**

In this example, rHuPH20 was transiently expressed in four Lectin resistant CHO mutants and hyaluronidase secretion and activity were assessed. The Lectin resistant CHO mutants are summarized in Table 14 below. Pro⁵ cells lack the

- 139 -

galactosyltransferase β 4galT-6 causing a reduction in galactosylated *N*-glycans (see, e.g., Lee et al. *J. Biol. Chem.* 276:13924-13934 (2001)). Lec1 cells lack *N*-acetylglucosaminyltransferase I activity and therefore do not synthesize complex or hybrid glycans (see, e.g., Chen and Stanley, *Glycobiology*, 13:43-50 (2003)). Lec2 and Lec8 are deficient in nucleotide-sugar transporters, which transport nucleotide-sugars across the ER or golgi membrane. Lec2 cells are unable to translocate CMP-sialic acid (namely CMP-NeuAc) therefore causing the expression of asialo cell surfaces (see, e.g., Eckhardt et al., *J. Biol. Chem.* 273:20189-20195 (1998)). Lec8 cells are unable to translocate UDP-galactose therefore causing glycans devoid of galactose (see, e.g., Bakker et al., *Glycobiology*, 15:193-201 (2005)).

Table 14. Lectin resistant CHO mutants		
CHO line	Biochemical Change	Genetic Change
Pro 5 (parent)	↓ Gal on N-glycans	No expression of β 4galT6
Lec1	↓ GlcNAc-TI	Insertion/deletion in <i>Mgat1</i> ORF
Lec2	↓ CMP-sialic acid Golgi transporter	Mutation in <i>Slc35a1</i> ORF
Lec8	↓ UDP-Gal Golgi transporter	Mutation in <i>Slc35a2</i> ORF

In brief, PH20sHis (encoding his-tagged PH20, SEQ ID NO:187) was transiently expressed in each of four strains of lectin resistant CHO mutants, including Lec1 (Cat No. CRL-1735, ATCC), Lec2 (Cat No. CRL-1736, ATCC), Lec8 (Cat No. CRL-1737, ATCC) and Pro 5 (Cat No. CRL-1781) as described in Example 2A above. Additionally, HZ24-mut(B/S) (encoding PH20 truncated at amino acid 482, SEQ ID NO:122) was transiently expressed in Pro 5 cells and as negative control, Pro 5 cells were subjected to a mock transfection. The resulting cell culture media was analyzed by Western blot analysis and hyaluronidase activity was measured using the biotinylated HA enzymatic assay (as described in Examples 3 and 5 above).

The results show that rHuPH20 expressed in the Lec mutants is secreted into the medium, as evidenced by a protein band at approximately 66 kDa. The results of the bHA enzymatic assay are set forth in Table 15 below, which sets for the lectin resistant CHO mutant, the PH20 encoding plasmid used to transfect the cells, and the PH20 activity at pH5.5 for both a 1:27 and 1:81 dilution. rHuPH20 expressed by Lec mutant cells is enzymatically active.

- 140 -

Table 15. PH20 activity (U/mL) of rHuPH20 transiently expressed in Lec mutant cells.

Example 10

Site-Directed Mutagenesis of Human PH20 Hyaluronidase N-glycosylation Sites

In this example, N-glycan site specific human PH20 hyaluronidase
 5 deglycosylation mutants were generated and their secretion patterns and
 hyaluronidase enzymatic activity were assessed. The N-glycan site specific
 deglycosylation mutants and glycan types are set forth in Table 16 below.

PH20sHis (SEQ ID NO:210) was used as a template for mutagenesis of each
 asparagine residue to alanine using QuikChange® Site-Directed Mutagenesis Kit (Cat
 10 No. 200518, Stratagene). The protein encoded by the template DNA corresponds to
 PH20sHis (SEQ ID NO:187), a human PH20 clone that contains a HexaHis tag (SEQ
 ID NO:142) after amino acid S490. Wild type PH20sHis and deglycosylated mutants
 are set forth in Table 16. Six single mutants were generated, one for each of the N-
 glycosylation sites. Additionally, three double mutants and a triple mutant were
 15 generated for asparagines N82, N166 and N254, all of which are occupied by
 complex type glycans. Finally, a double mutant N368A/N393A was generated,
 lacking high mannose glycans. The mutants were transfected into CHO-S cells and
 expression was performed as described in Example 2A. Secretion into the media and
 hyaluronidase activity were determined as described in Examples 3 and 5, above.

20 The results are shown in Table 16 below, which sets forth the mutation, the
 glycan types, whether the protein was secreted into the media and the hyaluronidase
 activity at both pH 5.5 and pH 7.4. Western blot analysis showed that mutation of
 residues N82, N166, N235 and N254 had no effect on secretion of the rHuPH20
 protein into the media. Alternatively, mutation of residues N368A and

- 141 -

N368A/N393A prevented PH20 expression and secretion, as evidenced by a lack of protein at approximately 66 kDa in the media. Mutation of residue N393A resulted in reduced protein expression, but rHuPH20 was observed in the media, as evidenced by a protein band at approximately 66 kDa. Mutation of a residues N82, N166 and/or N254 had no effect on rHuPH20 activity. These residues are occupied by complex glycans. In contrast, mutation of residues N235, N368 and/or N393, which contain high mannose glycans, resulted in a complete loss of detectable activity in the media due to a lack of secretion.

Table 16. Human PH20 Hyaluronidase Deglycosylation Mutants					
Mutant	SEQ ID NO	Glycan Type	Secretion	Activity pH 5.5	Activity pH 7.4
PH20sHis (parent)	187	Both	YES	YES	YES
N82A	202	Complex	YES	YES	YES
N166A	203	Complex	YES	YES	YES
N235A	204	High Mannose (80%) Complex (20%)	YES	NO	NO
N254A	205	Complex	YES	YES	YES
N368A	188	High Mannose	NO	NO	NO
N393A	189	High Mannose	YES (WEAK)	NO	NO
N82A/N166A	206	Complex	YES	YES	YES
N82A/N254A	207	Complex	YES	YES	YES
N166A/N254A	208	Complex	YES	YES	YES
N82A/N166A/N254A	209	Complex	YES	YES	YES
N368A/N393A	190	High Mannose	NO	NO	NO

Immunofluorescent analysis of CHO cells with an anti-PH20 antibody was used to visualize the expression of the N-glycan site specific deglycosylation mutants N368A, N393A and N368A/N393A. CHO cells were seeded for monolayer culture onto 8-well chamber slides with 200 μ L of cells at 2.5×10^4 cells per ml of Dulbecco's Modified Eagle Medium (DMEM) containing 10 % fetal bovine serum (FBS) and grown at 37 °C in a humidified atmosphere of 5 % CO₂. Cells were transfected 36 hours later at 80 % confluency using Lipofectamine™ 2000 (Invitrogen) as follows. DNA (0.4 μ g in 50 μ L of DMEM without serum) and Lipofectamine™ 2000 (1 μ L in DMEM without serum) were mixed gently for 20 minutes at room temperature and then added to each well containing cells and 100 μ L

- 142 -

serum free medium. Mixing was effected by gently rocking the plate back and forth. The cells were then incubated at 37 °C in a CO₂ incubator for 4-6 hours after which the medium was replaced with medium containing 10 % FBS. At 48 hours post-transfection, the cells on the chamber slides were fixed with 4 % paraformaldehyde for 15 minutes. The cells were washed 3x with PBS and 200 µL of a 1 % NP-40/PBS solution was added and incubated for 30 minutes at room temperature. The cells were washed 3x with PBS and stored at 4 °C prior to immunolabeling.

To immunolabel the cells, the samples were blocked with 15 % normal goat serum for 30 minutes at room temperature. The cells were incubated with a 1:20 solution of anti-PH20 rabbit IgG diluted in 5 % normal goat serum in PBS for 2 hours. Finally, the cells were washed 3x with PBS followed by incubation with a FITC-conjugated goat anti-rabbit IgG for 1 hour followed by visualization. In addition, the mounting solution contained DAPI allowing for nuclei staining. Immunofluorescent analysis using the anti-PH20 antibody showed that N368A and N393A mutations caused PH20 to accumulate inside the cells.

Summary of N-glycosylation studies

As exhibited in Examples 7-10 above, N-linked glycosylation is essential for proper folding and enzymatic activity of rHuPH20. Complete deglycosylation of rHuPH20, effected by exhaustive digestion with PNGaseF or by inhibition of glycosylation during biosynthesis by treatment with tunicamycin, abolished all detectible enzymatic activity. In addition, unglycosylated rHuPH20 was shown to accumulate in the cell. In contrast, partially deglycosylated rHuPH20, effected by treatment with kifunensine or by expression in Lec mutants, retained enzymatic activity. Finally, detailed mutational analysis using site-directed mutagenesis revealed that the presence of high mannose type glycans is necessary for production of soluble, enzymatically active rHuPH20.

Example 11

Generation of a soluble rHuPH20 -expressing cell line

The HZ24 plasmid (set forth in SEQ ID NO:140) was used to transfect Chinese Hamster Ovary (CHO cells) (see *e.g.* U.S. Patent Application Nos.

- 143 -

10,795,095, 11/065,716 and 11/238,171). The HZ24 plasmid vector for expression of soluble rHuPH20 contains a pCI vector backbone (Promega), DNA encoding amino acids 1-482 of human PH20 hyaluronidase (SEQ ID NO:110), an internal ribosomal entry site (IRES) from the ECMV virus (Clontech), and the mouse dihydrofolate reductase (DHFR) gene. The pCI vector backbone also includes DNA encoding the Beta-lactamase resistance gene (AmpR), an fl origin of replication, a Cytomegalovirus immediate-early enhancer/promoter region (CMV), a chimeric intron, and an SV40 late polyadenylation signal (SV40). The DNA encoding the soluble rHuPH20 construct contains an NheI site and a Kozak consensus sequence prior to the DNA encoding the methionine at amino acid position 1 of the native 35 amino acid signal sequence of human PH20, and a stop codon following the DNA encoding the tyrosine corresponding to amino acid position 482 of the human PH20 hyaluronidase set forth in SEQ ID NO:107, followed by a BamHI restriction site. The construct pCI-PH20-IRES-DHFR-SV40pa (HZ24), therefore, results in a single mRNA species driven by the CMV promoter that encodes amino acids 1-482 of human PH20 (set forth in SEQ ID NO:109 and amino acids 1-186 of mouse dihydrofolate reductase (set forth in SEQ ID NO:141), separated by the internal ribosomal entry site (IRES).

Non-transfected DG44 CHO cells growing in GIBCO Modified CD-CHO media for DHFR(-) cells, supplemented with 4 mM Glutamine and 18 ml/L Plurionic F68/L (Gibco), were seeded at 0.5×10^6 cells/ml in a shaker flask in preparation for transfection. Cells were grown at 37 °C in 5% CO₂ in a humidified incubator, shaking at 120 rpm. Exponentially growing non-transfected DG44 CHO cells were tested for viability prior to transfection.

Sixty million viable cells of the non-transfected DG44 CHO cell culture were pelleted and resuspended to a density of 2×10^7 cells in 0.7 mL of 2x transfection buffer (2x HeBS: 40 mM Hepes, pH 7.0, 274 mM NaCl, 10 mM KCl, 1.4 mM Na₂HPO₄, 12 mM dextrose). To each aliquot of resuspended cells, 0.09 mL (250 µg) of the linear HZ24 plasmid (linearized by overnight digestion with Cla I (New England Biolabs) was added, and the cell/DNA solutions were transferred into 0.4 cm gap BTX (Gentronics) electroporation cuvettes at room temperature. A negative

- 144 -

control electroporation was performed with no plasmid DNA mixed with the cells. The cell/plasmid mixes were electroporated with a capacitor discharge of 330 V and 960 μ F or at 350 V and 960 μ F.

The cells were removed from the cuvettes after electroporation and transferred into 5 mL of Modified CD-CHO media for DHFR(-) cells, supplemented with 4 mM Glutamine and 18 ml/L Plurionic F68/L (Gibco), and allowed to grow in a well of a 6-well tissue culture plate without selection for 2 days at 37° C in 5% CO₂ in a humidified incubator.

Two days post-electroporation, 0.5 mL of tissue culture media was removed from each well and tested for the presence of hyaluronidase activity, using the microturbidity assay described in Example 12. Results are shown in Table 17.

Table 17. Initial Hyaluronidase Activity of HZ24 Transfected DG44 CHO cells at 40 hours post-transfection		
	Dilution	Activity Units/ml
Transfection 1 330V	1 to 10	0.25
Transfection 2 350V	1 to 10	0.52
Negative Control	1 to 10	0.015

Cells from Transfection 2 (350V) were collected from the tissue culture well, counted and diluted to 1×10^4 to 2×10^4 viable cells per mL. A 0.1 mL aliquot of the cell suspension was transferred to each well of five, 96 well round bottom tissue culture plates. One hundred microliters of CD-CHO media (GIBCO) containing 4 mM GlutaMAX™-1 supplement (GIBCO™, Invitrogen Corporation) and without hypoxanthine and thymidine supplements were added to the wells containing cells (final volume 0.2 mL).

Ten clones were identified from the 5 plates grown without methotrexate (Table 18).

Table 18. Hyaluronidase activity of identified clones	
Plate/Well ID	Relative Hyaluronidase
1C3	261
2C2	261
3D3	261
3E5	243
3C6	174

- 145 -

2G8	103
1B9	304
2D9	273
4D10	302

Six HZ24 clones were expanded in culture and transferred into shaker flasks as single cell suspensions. Clones 3D3, 3E5, 2G8, 2D9, 1E11, and 4D10 were plated into 96-well round bottom tissue culture plates using a two-dimensional infinite dilution strategy in which cells were diluted 1:2 down the plate, and 1:3 across the plate, starting at 5000 cells in the top left hand well. Diluted clones were grown in a background of 500 non-transfected DG44 CHO cells per well, to provide necessary growth factors for the initial days in culture. Ten plates were made per subclone, with 5 plates containing 50 nM methotrexate and 5 plates without methotrexate.

Clone 3D3 produced 24 visual subclones (13 from the no methotrexate treatment, and 11 from the 50 nM methotrexate treatment. Significant hyaluronidase activity was measured in the supernatants from 8 of the 24 subclones (>50 Units/mL), and these 8 subclones were expanded into T-25 tissue culture flasks. Clones isolated from the methotrexate treatment protocol were expanded in the presence of 50 nM methotrexate. Clone 3D35M was further expanded in 500 nM methotrexate giving rise to clones producing in excess of 1,000 Units/ml in shaker flasks (clone 3D35M; or Gen1 3D35M). A master cell bank (MCB) of the 3D35M cells was then prepared.

Example 12

Determination of hyaluronidase activity of soluble rHuPH20

Hyaluronidase activity of soluble rHuPH20 in samples such as cell cultures, purification fractions and purified solutions was determined using a turbidometric assay, which is based on the formation of an insoluble precipitate when hyaluronic acid binds with serum albumin. The activity is measured by incubating soluble rHuPH20 with sodium hyaluronate (hyaluronic acid) for a set period of time (10 minutes) and then precipitating the undigested sodium hyaluronate with the addition of acidified serum albumin. The turbidity of the resulting sample is measured at 640 nm after a 30 minute development period. The decrease in turbidity resulting from enzyme activity on the sodium hyaluronate substrate is a measure of the soluble

- 146 -

rHuPH20 hyaluronidase activity. The method is performed using a calibration curve generated with dilutions of a soluble rHuPH20 assay working reference standard, and sample activity measurements are made relative to this calibration curve.

- Dilutions of the sample were prepared in Enzyme Diluent Solution. The
- 5 Enzyme Diluent Solution was prepared by dissolving 33.0 ± 0.05 mg of hydrolyzed gelatin in 25.0 mL of the 50 mM PIPES Reaction Buffer (140 mM NaCl, 50 mM PIPES, pH 5.5) and 25.0 mL of SWFI, and diluting 0.2 mL of 25% Buminat solution into the mixture and vortexing for 30 seconds. This was performed within 2 hours of use and stored on ice until needed. The samples were diluted to an estimated 1-2
- 10 U/mL. Generally, the maximum dilution per step did not exceed 1:100 and the initial sample size for the first dilution was not be less than 20 μ L. The minimum sample volumes needed to perform the assay were: In-process Samples, FPLC Fractions: 80 μ L; Tissue Culture Supernatants: 1 mL; Concentrated Material 80 μ L; Purified or Final Step Material: 80 μ L. The dilutions were made in triplicate in a Low Protein
- 15 Binding 96-well plate, and 30 μ L of each dilution was transferred to Optilux black/clear bottom plates (BD BioSciences).

- Dilutions of known soluble rHuPH20 with a concentration of 2.5 U/mL were prepared in Enzyme Diluent Solution to generate a standard curve and added to the Optilux plate in triplicate. The dilutions included 0 U/mL, 0.25 U/mL, 0.5 U/mL, 1.0
- 20 U/mL, 1.5 U/mL, 2.0 U/mL, and 2.5 U/mL. "Reagent blank" wells that contained 60 μ L of Enzyme Diluent Solution were included in the plate as a negative control. The plate was then covered and warmed on a heat block for 5 minutes at 37 °C. The cover was removed and the plate was shaken for 10 seconds. After shaking, the plate was returned to the heat block and the MULTIDROP 384 Liquid Handling Device was
- 25 primed with the warm 0.25 mg/mL sodium hyaluronate solution (prepared by dissolving 100 mg of sodium hyaluronate (LifeCore Biomedical) in 20.0 mL of SWFI. This was mixed by gently rotating and/or rocking at 2-8 °C for 2-4 hours, or until completely dissolved). The reaction plate was transferred to the MULTIDROP 384 and the reaction was initiated by pressing the start key to dispense 30 μ L sodium
- 30 hyaluronate into each well. The plate was then removed from the MULTIDROP 384

- 147 -

and shaken for 10 seconds before being transferred to a heat block with the plate cover replaced. The plate was incubated at 37 °C for 10 minutes

The MULTIDROP 384 was prepared to stop the reaction by priming the machine with Serum Working Solution and changing the volume setting to 240 µL.

5 (25 mL of Serum Stock Solution [1 volume of Horse Serum (Sigma) was diluted with 9 volumes of 500 mM Acetate Buffer Solution and the pH was adjusted to 3.1 with hydrochloric acid] in 75 mL of 500 mM Acetate Buffer Solution). The plate was removed from the heat block and placed onto the MULTIDROP 384 and 240 µL of serum Working Solutions was dispensed into the wells. The plate was removed and
10 shaken on a plate reader for 10 seconds. After a further 15 minutes, the turbidity of the samples was measured at 640 nm and the hyaluronidase activity (in U/mL) of each sample was determined by fitting to the standard curve.

Specific activity (Units/mg) was calculated by dividing the hyaluronidase activity (U/ml) by the protein concentration (mg/mL).

15

Example 13

Production and Purification of Gen1 Human sPH20

A. 5 L Bioreactor Process

A vial of 3D35M was thawed and expanded from shaker flasks through 1 L spinner flasks in CD-CHO media (Invitrogen, Carlsbad Calif.) supplemented with 100
20 nM Methotrexate and GlutaMAX™-1 (Invitrogen). Cells were transferred from spinner flasks to a 5 L bioreactor (Braun) at an inoculation density of 4×10^5 viable cells per ml. Parameters were temperature Setpoint 37 °C, pH 7.2 (starting Setpoint), with Dissolved Oxygen Setpoint 25% and an air overlay of 0-100 cc/min. At 168 hrs, 250 ml of Feed #1 Medium (CD CHO with 50 g/L Glucose) was added. At 216 hours,
25 250 ml of Feed #2 Medium (CD CHO with 50 g/L Glucose and 10 mM Sodium Butyrate) was added, and at 264 hours 250 ml of Feed #2 Medium was added. This process resulted in a final productivity of 1600 Units per ml with a maximal cell density of 6×10^6 cells/ml. The addition of sodium butyrate was to dramatically enhance the production of soluble rHuPH20 in the final stages of production.
30 Conditioned media from the 3D35M clone was clarified by depth filtration and tangential flow diafiltration into 10 mM Hepes pH 7.0. Soluble rHuPH20 was

- 148 -

then purified by sequential chromatography on Q Sepharose (Pharmacia) ion exchange, Phenyl Sepharose (Pharmacia) hydrophobic interaction chromatography, phenyl boronate (Prometix) and Hydroxapatite Chromatography (Biorad, Richmond, CA).

5 Soluble rHuPH20 bound to Q Sepharose and eluted at 400 mM NaCl in the same buffer. The eluate was diluted with 2M ammonium sulfate to a final concentration of 500 mM ammonium sulfate and passed through a Phenyl Sepharose (low sub) column, followed by binding under the same conditions to a phenyl boronate resin. The soluble rHuPH20 was eluted from the phenyl sepharose resin in
10 Hepes pH 6.9 after washing at pH 9.0 in 50 mM bicine without ammonium sulfate. The eluate was loaded onto a ceramic hydroxyapatite resin at pH 6.9 in 5 mM potassium phosphate and 1 mM CaCl_2 and eluted with 80 mM potassium phosphate, pH 7.4 with 0.1 mM CaCl_2 .

The resultant purified soluble rHuPH20 possessed a specific activity in excess
15 of 65,000 USP Units/mg protein by way of the microturbidity assay (Example 12) using the USP reference standard. Purified sPH20 eluted as a single peak from 24 to 26 minutes from a Pharmacia 5RPC styrene divinylbenzene column with a gradient between 0.1% TFA/ H_2O and 0.1% TFA/90% acetonitrile/10% H_2O and resolved as a single broad 61 kDa band by SDS electrophoresis that reduced to a sharp 51 kDa band
20 upon treatment with PNGASE-F. N-terminal amino acid sequencing revealed that the leader peptide had been efficiently removed.

B. Upstream Cell Culture Expansion Process into 100 L Bioreactor Cell Culture

A scaled-up process was used to separately purify soluble rHuPH20 from four
25 different vials of 3D35M cell to produce 4 separate batches of sHuPH20; HUA0406C, HUA0410C, HUA0415C and HUA0420C. Each vial was separately expanded and cultured through a 125 L bioreactor, then purified using column chromatography. Samples were taken throughout the process to assess such parameters as enzyme yield. The description of the process provided below sets forth representative
30 specifications for such things as bioreactor starting and feed media volumes, transfer

- 149 -

cell densities, and wash and elution volumes. The exact numbers vary slightly with each batch, and are detailed in Tables 24 to 30.

Four vials of 3D35M cells were thawed in a 37°C water bath, CD CHO containing 100 nM methotrexate and 40 mL/L GlutaMAX was added and the cells were centrifuged. The cells were re-suspended in a 125 mL shake flask with 20 mL of fresh media and placed in a 37°C, 7% CO₂ incubator. The cells were expanded up to 40 mL in the 125 mL shake flask. When the cell density reached $1.5 - 2.5 \times 10^6$ cells/mL, the culture was expanded into a 125 mL spinner flask in a 100 mL culture volume. The flask was incubated at 37°C, 7% CO₂. When the cell density reached $1.5 - 2.5 \times 10^6$ cells/mL, the culture was expanded into a 250 mL spinner flask in 200 mL culture volume, and the flask was incubated at 37°C, 7% CO₂. When the cell density reached $1.5 - 2.5 \times 10^6$ cells/mL, the culture was expanded into a 1 L spinner flask in 800 mL culture volume and incubated at 37°C, 7% CO₂. When the cell density reached $1.5 - 2.5 \times 10^6$ cells/mL, the culture was expanded into a 6 L spinner flask in 5 L culture volume and incubated at 37°C, 7% CO₂. When the cell density reached $1.5 - 2.5 \times 10^6$ cells/mL, the culture was expanded into a 36 L spinner flask in 20 L culture volume and incubated at 37°C, 7% CO₂.

A 125 L reactor was sterilized with steam at 121°C, 20 PSI and 65 L of CD CHO media was added. Before use, the reactor was checked for contamination. When the cell density in the 36 L spinner flasks reached $1.8 - 2.5 \times 10^6$ cells/mL, 20 L cell culture were transferred from the 36L spinner flasks to the 125 L bioreactor (Braun), resulting a final volume of 85 L and a seeding density of approximately 4×10^5 cells/mL. Parameters were temperature setpoint, 37°C; pH: 7.2; Dissolved oxygen: 25% \pm 10%; Impeller Speed 50 rpm; Vessel Pressure 3 psi; Air Sparge 1 L/min.; Air Overlay: 1 L/min. The reactor was sampled daily for cell counts, pH verification, media analysis, protein production and retention. Nutrient feeds were added during the run. At Day 6, 3.4 L of Feed #1 Medium (CD CHO + 50 g/L Glucose + 40 mL/L GlutaMAXTM-1) was added, and culture temperature was changed to 36.5°C. At day 9, 3.5 L of Feed #2 (CD CHO + 50 g/L Glucose + 40 mL/L GlutaMAXTM-1 + 1.1 g/L Sodium Butyrate) was added, and culture temperature was changed to 36°C. At day 11, 3.7 L of Feed #3 (CD CHO + 50 g/L

- 150 -

Glucose + 40 mL/L GlutaMAX™-1 + 1.1 g/L Sodium Butyrate) was added, and the culture temperature was changed to 35.5°C. The reactor was harvested at 14 days or when the viability of the cells dropped below 50%. The process resulted in production of soluble rHuPH20 with an enzymatic activity of 1600 Units/ml with a maximal cell density of 8 million cells/mL. At harvest, the culture was sampled for mycoplasma, bioburden, endotoxin, and virus *in vitro* and *in vivo*, transmission electron microscopy (TEM) for viral particles, and enzyme activity.

The one hundred liter bioreactor cell culture harvest was filtered through a series of disposable capsule filters having a polyethersulfone medium (Sartorius): first through a 8.0 µm depth capsule, a 0.65 µm depth capsule, a 0.22 µm capsule, and finally through a 0.22 µm Sartopore 2000 cm² filter and into a 100 L sterile storage bag. The culture was concentrated 10× using two TFF with Spiral Polyethersulfone 30 kDa MWCO filters (Millipore), followed by a 6× buffer exchange with 10 mM HEPES, 25 mM Na₂SO₄, pH 7.0 into a 0.22 µm final filter into a 20 L sterile storage bag. Table 19 provides monitoring data related to the cell culture, harvest, concentration and buffer exchange steps.

Table 19. Monitoring data for cell culture, harvest, concentration and buffer exchange steps.				
Parameter	HUA0406C	HUA04010C	HUA0415C	HUA0420C

volume(mL)				
Ratio enzyme units concentration/harvest	0.87	0.96	1.32	1.4

A Q Sepharose (Pharmacia) ion exchange column (3 L resin, Height = 20 cm, Diameter = 14 cm) was prepared. Wash samples were collected for a determination of pH, conductivity and endotoxin (LAL) assay. The column was equilibrated with 5 column volumes of 10 mM Tris, 20 mM Na₂SO₄, pH 7.5. The concentrated, diafiltered harvest was loaded onto the Q column at a flow rate of 100 cm/hr. The column was washed with 5 column volumes of 10 mM Tris, 20 mM Na₂SO₄, pH 7.5 and 10 mM Hepes, 50 mM NaCl, pH 7.0. The protein was eluted with 10 mM Hepes, 400 mM NaCl, pH 7.0 and filtered through a 0.22 µm final filter into a sterile bag.

Phenyl-Sepharose (Pharmacia) hydrophobic interaction chromatography was next performed. A Phenyl-Sepharose (PS) column (9.1 L resin, Height = 29 cm, Diameter = 20cm) was prepared. The column was equilibrated with 5 column volumes of 5 mM potassium phosphate, 0.5 M ammonium sulfate, 0.1 mM CaCl₂, pH 7.0. The protein eluate from above was supplemented with 2M ammonium sulfate, 1 M potassium phosphate and 1 M CaCl₂ stock solutions to final concentrations of 5 mM, 0.5 M and 0.1 mM, respectively. The protein was loaded onto the PS column at a flow rate of 100 cm/hr. 5 mM potassium phosphate, 0.5 M ammonium sulfate and 0.1 mM CaCl₂ pH 7.0 was added at 100 cm/hr. The flow through was passed through a 0.22 µm final filter into a sterile bag.

The PS-purified protein was the loaded onto an aminophenyl boronate column (ProMedics) (6.3 L resin, Height = 20 cm, Diameter = 20cm) that had been equilibrated with 5 column volumes of 5 mM potassium phosphate, 0.5 M ammonium sulfate. The protein was passed through the column at a flow rate of 100 cm/hr, and the column was washed with 5 mM potassium phosphate, 0.5 M ammonium sulfate, pH 7.0. The column was then washed with 20 mM bicine, 100 mM NaCl, pH 9.0 and the protein eluted with 50 mM Hepes, 100 mM NaCl pH 6.9 through a sterile filter and into a 20 L sterile bag. The eluate was tested for bioburden, protein concentration and enzyme activity.

A hydroxyapatite (HAP) column (BioRad) (1.6 L resin, Height = 10 cm, Diameter = 14 cm) was equilibrated with 5 mM potassium phosphate, 100 mM NaCl,

- 152 -

0.1 mM CaCl₂ pH 7.0. Wash samples were collected and tested for pH, conductivity and endotoxin (LAL assay). The aminophenyl boronate purified protein was supplemented with potassium phosphate and CaCl₂ to yield final concentrations of 5 mM potassium phosphate and 0.1 mM CaCl₂ and loaded onto the HAP column at a flow rate of 100 cm/hr. The column was washed with 5 mM potassium phosphate pH 7.0, 100 mM NaCl, 0.1 mM CaCl₂, then 10 mM potassium phosphate pH 7.0, 100 mM NaCl, 0.1 mM CaCl₂ pH. The protein was eluted with 70 mM potassium phosphate pH 7.0 and filtered through a 0.22 µm filter into a 5 L sterile storage bag. The eluate was tested for bioburden, protein concentration and enzyme activity.

The HAP-purified protein was then pumped through a 20 nm viral removal filter via a pressure tank. The protein was added to the DV20 pressure tank and filter (Pall Corporation), passing through an Ultipor DV20 Filter with 20 nm pores (Pall Corporation) into a sterile 20 L storage bag. The filtrate was tested for protein concentration, enzyme activity, oligosaccharide, monosaccharide and sialic acid profiling, and process-related impurities. The protein in the filtrate was then concentrated to 1 mg/mL using a 10 kD molecular weight cut off (MWCO) Sartocore Slice tangential flow filtration (TFF) system (Sartorius). The filter was first prepared by washing with a Hepes/saline solution (10 mM Hepes, 130 mM NaCl, pH 7.0) and the permeate was sampled for pH and conductivity. Following concentration, the concentrated protein was sampled and tested for protein concentration and enzyme activity. A 6× buffer exchange was performed on the concentrated protein into the final buffer: 10 mM Hepes, 130 mM NaCl, pH 7.0. The concentrated protein was passed through a 0.22 µm filter into a 20 L sterile storage bag. The protein was sampled and tested for protein concentration, enzyme activity, free sulfhydryl groups, oligosaccharide profiling and osmolality.

Tables 20 to 26 provide monitoring data related to each of the purification steps described above, for each 3D35M cell lot.

- 5 The purified and concentrated soluble rHuPH20 protein was aseptically filled into sterile vials with 5 mL and 1 mL fill volumes. The protein was passed through a

- 155 -

0.22 μ m filter to an operator controlled pump that was used to fill the vials using a gravimetric readout. The vials were closed with stoppers and secured with crimped caps. The closed vials were visually inspected for foreign particles and then labeled. Following labeling, the vials were flash-frozen by submersion in liquid nitrogen for
5 no longer than 1 minute and stored at $\leq -15^{\circ}\text{C}$ ($-20 \pm 5^{\circ}\text{C}$).

Example 14

Production Gen2 Cells Containing Soluble human PH20 (rHuPH20)

The Gen1 3D35M cell line described in Example 13 was adapted to higher
10 methotrexate levels to produce generation 2 (Gen2) clones. 3D35M cells were seeded from established methotrexate-containing cultures into CD CHO medium containing 4mM GlutaMAX-1™ and 1.0 μ M methotrexate. The cells were adapted to a higher methotrexate level by growing and passaging them 9 times over a period of 46 days in a 37 $^{\circ}\text{C}$, 7% CO_2 humidified incubator. The amplified population of cells
15 was cloned out by limiting dilution in 96-well tissue culture plates containing medium with 2.0 μ M methotrexate. After approximately 4 weeks, clones were identified and clone 3E10B was selected for expansion. 3E10B cells were grown in CD CHO medium containing 4 mM GlutaMAX-1™ and 2.0 μ M methotrexate for 20 passages. A master cell bank (MCB) of the 3E10B cell line was created and frozen and used for
20 subsequent studies.

Amplification of the cell line continued by culturing 3E10B cells in CD CHO medium containing 4 mM GlutaMAX-1™ and 4.0 μ M methotrexate. After the 12th passage, cells were frozen in vials as a research cell bank (RCB). One vial of the RCB was thawed and cultured in medium containing 8.0 μ M methotrexate. After 5 days,
25 the methotrexate concentration in the medium was increased to 16.0 μ M, then 20.0 μ M 18 days later. Cells from the 8th passage in medium containing 20.0 μ M methotrexate were cloned out by limiting dilution in 96-well tissue culture plates containing CD CHO medium containing 4 mM GlutaMAX-1™ and 20.0 μ M methotrexate. Clones were identified 5-6 weeks later and clone 2B2 was selected for
30 expansion in medium containing 20.0 μ M methotrexate. After the 11th passage, 2B2 cells were frozen in vials as a research cell bank (RCB).

- 156 -

The resultant 2B2 cells are dihydrofolate reductase deficient (dhfr-) DG44 CHO cells that express soluble recombinant human PH20 (rHuPH20). The soluble PH20 is present in 2B2 cells at a copy number of approximately 206 copies/cell. Southern blot analysis of Spe I-, Xba I- and BamH I/Hind III-digested genomic 2B2 cell DNA using a rHuPH20-specific probe revealed the following restriction digest profile: one major hybridizing band of ~7.7 kb and four minor hybridizing bands (~13.9, ~6.6, ~5.7 and ~4.6 kb) with DNA digested with Spe I; one major hybridizing band of ~5.0 kb and two minor hybridizing bands (~13.9 and ~6.5 kb) with DNA digested with Xba I; and one single hybridizing band of ~1.4 kb observed using 2B2 DNA digested with BamH I/Hind III. Sequence analysis of the mRNA transcript indicated that the derived cDNA (SEQ ID NO:139) was identical to the reference sequence (SEQ ID NO:110) except for one base pair difference at position 1131, which was observed to be a thymidine (T) instead of the expected cytosine (C). This is a silent mutation, with no effect on the amino acid sequence.

Example 15

A. Production of Gen2 soluble rHuPH20 in 300 L Bioreactor Cell Culture

A vial of HZ24-2B2 was thawed and expanded from shaker flasks through 36L spinner flasks in CD-CHO media (Invitrogen, Carlsbad, CA) supplemented with 20 μ M methotrexate and GlutaMAX-1™ (Invitrogen). Briefly, the vial of cells was thawed in a 37 °C water bath, media was added and the cells were centrifuged. The cells were re-suspended in a 125 mL shake flask with 20 mL of fresh media and placed in a 37 °C, 7% CO₂ incubator. The cells were expanded up to 40 mL in the 125 mL shake flask. When the cell density reached greater than 1.5×10^6 cells/mL, the culture was expanded into a 125 mL spinner flask in a 100 mL culture volume. The flask was incubated at 37 °C, 7% CO₂. When the cell density reached greater than 1.5×10^6 cells/mL, the culture was expanded into a 250 mL spinner flask in 200 mL culture volume, and the flask was incubated at 37 °C, 7% CO₂. When the cell density reached greater than 1.5×10^6 cells/mL, the culture was expanded into a 1 L spinner flask in 800 mL culture volume and incubated at 37 °C, 7% CO₂. When the cell density reached greater than 1.5×10^6 cells/mL the culture was expanded into a 6 L spinner flask in 5000 mL culture volume and incubated at 37 °C, 7% CO₂. When the

- 157 -

cell density reached greater than 1.5×10^6 cells/mL the culture was expanded into a 36 L spinner flask in 32 L culture volume and incubated at 37 °C, 7% CO₂.

A 400 L reactor was sterilized and 230 mL of CD-CHO media was added. Before use, the reactor was checked for contamination. Approximately 30 L cells
5 were transferred from the 36L spinner flasks to the 400 L bioreactor (Braun) at an inoculation density of 4.0×10^5 viable cells per ml and a total volume of 260L. Parameters were temperature setpoint, 37 °C; Impeller Speed 40-55 RPM; Vessel Pressure: 3 psi; Air Sparge 0.5- 1.5 L/Min.; Air Overlay: 3 L/ min. The reactor was sampled daily for cell counts, pH verification, media analysis, protein production and
10 retention. Also, during the run nutrient feeds were added. At 120 hrs (day 5), 10.4L of Feed #1 Medium (4× CD-CHO + 33 g/L Glucose + 160 mL/L Glutamax-1™ + 83 mL/L Yeastolate + 33 mg/L rHuInsulin) was added. At 168 hours (day 7), 10.8 L of Feed #2 (2× CD-CHO + 33 g/L Glucose + 80 mL/L Glutamax-1™ + 167 mL/L Yeastolate + 0.92 g/L Sodium Butyrate) was added, and culture temperature was
15 changed to 36.5°C. At 216 hours (day 9), 10.8 L of Feed #3 (1× CD-CHO + 50 g/L Glucose + 50 mL/L Glutamax-1™ + 250 mL/L Yeastolate + 1.80 g/L Sodium Butyrate) was added, and culture temperature was changed to 36° C. At 264 hours (day 11), 10.8 L of Feed #4 (1× CD-CHO + 33 g/L Glucose + 33 mL/L Glutamax-1™ + 250 mL/L Yeastolate + 0.92 g/L Sodium Butyrate) was added, and culture
20 temperature was changed to 35.5 °C. The addition of the feed media was observed to dramatically enhance the production of soluble rHuPH20 in the final stages of production. The reactor was harvested at 14 or 15 days or when the viability of the cells dropped below 40%. The process resulted in a final productivity of 17,000 Units per ml with a maximal cell density of 12 million cells/mL. At harvest, the
25 culture was sampled for mycoplasma, bioburden, endotoxin and viral *in vitro* and *in vivo*, Transmission Electron Microscopy (TEM) and enzyme activity.

The culture was pumped by a peristaltic pump through four Millistak filtration system modules (Millipore) in parallel, each containing a layer of diatomaceous earth graded to 4-8 µm and a layer of diatomaceous earth graded to 1.4-1.1 µm, followed by
30 a cellulose membrane, then through a second single Millistak filtration system (Millipore) containing a layer of diatomaceous earth graded to 0.4-0.11 µm and a

- 158 -

layer of diatomaceous earth graded to $<0.1\ \mu\text{m}$, followed by a cellulose membrane, and then through a $0.22\ \mu\text{m}$ final filter into a sterile single use flexible bag with a 350 L capacity. The harvested cell culture fluid was supplemented with 10 mM EDTA and 10 mM Tris to a pH of 7.5. The culture was concentrated $10\times$ with a tangential
5 flow filtration (TFF) apparatus using four Sartoslice TFF 30 kDa molecular weight cut-off (MWCO) polyether sulfone (PES) filter (Sartorius), followed by a $10\times$ buffer exchange with 10 mM Tris, 20mM Na_2SO_4 , pH 7.5 into a $0.22\ \mu\text{m}$ final filter into a 50 L sterile storage bag.

The concentrated, diafiltered harvest was inactivated for virus. Prior to viral
10 inactivation, a solution of 10% Triton® X-100, 3% tri (n-butyl) phosphate (TNBP) was prepared. The concentrated, diafiltered harvest was exposed to 1% Triton® X-100, 0.3% TNBP for 1 hour in a 36 L glass reaction vessel immediately prior to purification on the Q column.

B. Purification of Gen2 soluble rHuPH20

15 A Q Sepharose (Pharmacia) ion exchange column (9 L resin, H= 29 cm, D= 20 cm) was prepared. Wash samples were collected for a determination of pH, conductivity and endotoxin (LAL) assay. The column was equilibrated with 5 column volumes of 10 mM Tris, 20 mM Na_2SO_4 , pH 7.5. Following viral inactivation, the concentrated, diafiltered harvest was loaded onto the Q column at a
20 flow rate of 100 cm/hr. The column was washed with 5 column volumes of 10 mM Tris, 20 mM Na_2SO_4 , pH 7.5 and 10 mM Hepes, 50 mM NaCl, pH 7.0. The protein was eluted with 10 mM Hepes, 400 mM NaCl, pH 7.0 into a $0.22\ \mu\text{m}$ final filter into sterile bag. The eluate sample was tested for bioburden, protein concentration and hyaluronidase activity. A_{280} absorbance readings were taken at the beginning and end
25 of the exchange.

Phenyl-Sepharose (Pharmacia) hydrophobic interaction chromatography was next performed. A Phenyl-Sepharose (PS) column (19-21 L resin, H=29 cm, D= 30 cm) was prepared. The wash was collected and sampled for pH, conductivity and endotoxin (LAL assay). The column was equilibrated with 5 column volumes of 5
30 mM potassium phosphate, 0.5 M ammonium sulfate, 0.1 mM CaCl_2 , pH 7.0. The protein eluate from the Q sepharose column was supplemented with 2M ammonium

- 159 -

sulfate, 1 M potassium phosphate and 1 M CaCl_2 stock solutions to yield final concentrations of 5 mM, 0.5 M and 0.1 mM, respectively. The protein was loaded onto the PS column at a flow rate of 100 cm/hr and the column flow thru collected. The column was washed with 5 mM potassium phosphate, 0.5 M ammonium sulfate and 0.1 mM CaCl_2 pH 7.0 at 100 cm/hr and the wash was added to the collected flow thru. Combined with the column wash, the flow through was passed through a 0.22 μm final filter into a sterile bag. The flow through was sampled for bioburden, protein concentration and enzyme activity.

An aminophenyl boronate column (Prometec) was prepared. The wash was collected and sampled for pH, conductivity and endotoxin (LAL assay). The column was equilibrated with 5 column volumes of 5 mM potassium phosphate, 0.5 M ammonium sulfate. The PS flow through containing purified protein was loaded onto the aminophenyl boronate column at a flow rate of 100 cm/hr. The column was washed with 5 mM potassium phosphate, 0.5 M ammonium sulfate, pH 7.0. The column was washed with 20 mM bicine, 0.5 M ammonium sulfate, pH 9.0. The column was washed with 20 mM bicine, 100 mM sodium chloride, pH 9.0. The protein was eluted with 50 mM Hepes, 100 mM NaCl, pH 6.9 and passed through a sterile filter into a sterile bag. The eluted sample was tested for bioburden, protein concentration and enzyme activity.

The hydroxyapatite (HAP) column (Biorad) was prepared. The wash was collected and tested for pH, conductivity and endotoxin (LAL assay). The column was equilibrated with 5 mM potassium phosphate, 100 mM NaCl, 0.1 mM CaCl_2 , pH 7.0. The aminophenyl boronate purified protein was supplemented to final concentrations of 5 mM potassium phosphate and 0.1 mM CaCl_2 and loaded onto the HAP column at a flow rate of 100 cm/hr. The column was washed with 5 mM potassium phosphate, pH 7, 100 mM NaCl, 0.1 mM CaCl_2 . The column was next washed with 10 mM potassium phosphate, pH 7, 100 mM NaCl, 0.1 mM CaCl_2 . The protein was eluted with 70 mM potassium phosphate, pH 7.0 and passed through a 0.22 μm sterile filter into a sterile bag. The eluted sample was tested for bioburden, protein concentration and enzyme activity.

- 160 -

The HAP purified protein was then passed through a viral removal filter. The sterilized Viosart filter (Sartorius) was first prepared by washing with 2 L of 70 mM potassium phosphate, pH 7.0. Before use, the filtered buffer was sampled for pH and conductivity. The HAP purified protein was pumped via a peristaltic pump through
5 the 20 nM viral removal filter. The filtered protein in 70 mM potassium phosphate, pH 7.0 was passed through a 0.22 µm final filter into a sterile bag. The viral filtered sample was tested for protein concentration, enzyme activity, oligosaccharide, monosaccharide and sialic acid profiling. The sample also was tested for process related impurities.

10 The protein in the filtrate was then concentrated to 10 mg/mL using a 10 kD molecular weight cut off (MWCO) Sartocore Slice tangential flow filtration (TFF) system (Sartorius). The filter was first prepared by washing with 10 mM histidine, 130 mM NaCl, pH 6.0 and the permeate was sampled for pH and conductivity. Following concentration, the concentrated protein was sampled and tested for protein
15 concentration and enzyme activity. A 6× buffer exchange was performed on the concentrated protein into the final buffer: 10 mM histidine, 130 mM NaCl, pH 6.0. Following buffer exchange, the concentrated protein was passed through a 0.22 µm filter into a 20 L sterile storage bag. The protein was sampled and tested for protein concentration, enzyme activity, free sulfhydryl groups, oligosaccharide profiling and
20 osmolality.

The sterile filtered bulk protein was then aseptically dispensed at 20 mL into 30 mL sterile Teflon vials (Nalgene). The vials were then flash frozen and stored at -20 ± 5°C.

25 **C. Comparison of production and purification of Gen1 soluble rHuPH20 and Gen2 soluble rHuPH20**

The production and purification of Gen2 soluble rHuPH20 in a 300L bioreactor cell culture contained some changes in the protocols compared to the production and purification Gen1 soluble rHuPH20 in a 100L bioreactor cell culture (described in Example 13B). Table 27 sets forth exemplary differences, in addition to
30 simple scale up changes, between the methods.

Table 27.		
Process Difference	Gen1 soluble rHuPH20	Gen2 soluble rHuPH20

Example 16**Determination of sialic acid and monosaccharide content**

The sialic acid and monosaccharide content of soluble rHuPH20 can be assessed by reverse phase liquid chromatography (RPLC) following hydrolysis with trifluoroacetic acid. In one example, the sialic acid and monosaccharide content of purified hyaluronidase lot # HUB0701E (1.2 mg/mL; produced and purified essentially as described in Example 15) was determined. Briefly, 100 µg sample was hydrolyzed with 40 % (v/v) trifluoroacetic acid at 100 °C for 4 hours in duplicate. Following hydrolysis, the samples were dried down and resuspended in 300 µL water. A 45 µL aliquot from each re-suspended sample was transferred to a new tube and dried down, and 10 µL of a 10 mg/mL sodium acetate solution was added to each. The released monosaccharides were fluorescently labeled by the addition of 50 µL of a solution containing 30 mg/mL 2-aminobenzoic acid, 20 mg/mL sodium cyanoborohydride, approximately 40 mg/mL sodium acetate and 20 mg/mL boric acid in methanol. The mixture was incubated for 30 minutes at 80 °C in the dark. The derivitization reaction was quenched by the addition of 440 µL of mobile phase A (0.2% (v/v) n-butylamine, 0.5% (v/v) phosphoric acid, 1% (v/v) tetrahydrofuran). A matrix blank of water also was hydrolyzed and derivitized as described for the hyaluronidase sample as a negative control. The released monosaccharides were separated by RPLC using an Octadecyl (C₁₈) reverse phase column (4.6 x 250 mm, 5 µm particle size; J.T. Baker) and monitored by fluorescence detection (360 nm excitation, 425 nm emission). Quantitation of the monosaccharide content was made by comparison of the chromatograms from the hyaluronidase sample with chromatograms of monosaccharide standards including *N*-D-glucosamine (GlcN), *N*-D-galactosamine (GalN), galactose, fucose and mannose. Table 28 presents the molar ratio of each monosaccharide per hyaluronidase molecule.

Table 28. Monosaccharide content of soluble rHuPH20

Example 17**C-terminal heterogeneity of soluble rHuPH20 from 3D35M and 2B2 cells**

5 C-terminal sequencing was performed on two lots of sHuPH20 produced and purified from 3D35M cells in a 100 L bioreactor volume (Lot HUA0505MA) and 2B2 cells in a 300L bioreactor volume (Lot HUB0701EB). The lots were separately digested with endoproteinase Asp-N, which specifically cleaves peptide bonds N-terminally at aspartic and cysteic acid. This releases the C-terminal portion of the

10 soluble rHuPH20 at the aspartic acid at position 431 of SEQ ID NO:122. The C-terminal fragments were separated and characterized to determine the sequence and abundance of each population in Lot HUA0505MA and Lot HUB0701EB.

It was observed that the soluble rHuPH20 preparations from 3D35M cells and 2B2 cells displayed heterogeneity, and contained polypeptides that differed from one

15 another in their C-terminal sequence (Tables 30 and 31). This heterogeneity is likely the result of C-terminal cleavage of the expressed 447 amino acid polypeptide (SEQ ID NO:122) by peptidases present in the cell culture medium or other solutions during the production and purification process. The polypeptides in the soluble rHuPH20 preparations have amino acid sequences corresponding to amino acids 1-447, 1-446,

20 1-445, 1-444 and 1-443 of the soluble rHuPH20 sequence set forth SEQ ID NO:122. The full amino acid sequence of each of these polypeptides is forth in SEQ ID NOS: 122 to126, respectively. As noted in tables 29 and 30, the abundance of each polypeptide in the soluble rHuPH20 preparations from 3D35M cells and 2B2 cells differs.

Since modifications will be apparent to those of skill in this art, it is intended
5 that this invention be limited only by the scope of the appended claims.

- 166 -

CLAIMS:

1. An extended soluble PH20 hyaluronidase (esPH20).
2. An esPH20 of claim 1 that is N-glycosylated, N-partially glycosylated or is deglycosylated.
- 5 3. An esPH20 of claim 1 or claim 2, wherein the N-partially glycosylated polypeptide comprises at least an N-acetylglucosamine moiety linked to each of at least three asparagine (N) residues.
4. An esPH20 of claim 3, wherein the three asparagine residues are amino acid residues 235, 368 and 393 of SEQ ID NO: 107 or are residues corresponding to
10 amino acid residues 235, 368 and 393 of SEQ ID NO: 107.
5. An esPH20 of any of claims 1-4 that is selected from among:
a polypeptide that consists of the sequence of amino acids set forth in any of SEQ ID NOS: 60-63 and 102-104; or
a polypeptide that contains amino acid substitutions in the sequence of amino
15 acids set forth in any of SEQ ID NOS: 60-63 and 102-104, whereby the amino acid-substituted polypeptide consists of a sequence of amino acids that has at least 85%, 87%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more sequence identity with the corresponding sequence of amino acids set forth in any of SEQ ID NOS: 60-63 and 102-104.
- 20 6. An esPH20 of any of claims 1-5 that is neutral active.
7. An esPH20 of any of claims 1-5 that is a human esPH20.
8. An esPH20 of any of claims 1-4 that is a chimpanzee esPH20.
9. An esPH20 of claim 5 that consists of the sequence of amino acids set forth in any of SEQ ID NOS: 60-63 and 102-104.
- 25 10. An esPH20 of any of claims 1-4 that is selected from among:
a polypeptide that consists of the sequence of amino acids set forth as amino acids 36-491, 36-492, 36-493, 36-494, 36-495, 36-496, 36-497, 36-498, 36-499 or 36-500 of SEQ ID NO: 107; or
a polypeptide that contains amino acid substitutions in the sequence of amino
30 acids set forth as amino acids 36-491, 36-492, 36-493, 36-494, 36-495, 36-496, 36-497, 36-498, 36-499 or 36-500 of SEQ ID NO: 107, whereby the amino acid-

RECTIFIED SHEET (RULE 91) ISA/EP

- 167 -

substituted polypeptide consists of a sequence of amino acids that has at least 85%, 87%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more sequence identity with the corresponding sequence of amino acids set forth as amino acids 36-491, 36-492, 36-493, 36-494, 36-495, 36-496, 36-497, 36-498, 36-499 or 36-500 of SEQ ID NO: 107.

11. An esPH20 of claim 10 that consists of the sequence of amino acids set forth as amino acids 36-491, 36-492, 36-493, 36-494, 36-495, 36-496, 36-497, 36-498, 36-499 or 36-500 of SEQ ID NO: 107.

12. A truncated PH20 hyaluronidase that consists of the sequence of amino acids set forth as amino acids 1-465, 1-491, 1-492, 1-493, 1-494, 1-495, 1-496, 1-497, 1-498, 1-499 or 1-500 of SEQ ID NO: 107; or

contains amino acid substitutions in the sequence of amino acids set forth as amino acids 1-465, 1-491, 1-492, 1-493, 1-494, 1-495, 1-496, 1-497, 1-498, 1-499 or 1-500 of SEQ ID NO: 107, whereby the amino acid-substituted PH20 hyaluronidase consists of a sequence of amino acids that has at least 85%, 87%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more sequence identity with the sequence of amino acids set forth as amino acids 1-465, 1-491, 1-492, 1-493, 1-494, 1-495, 1-496, 1-497, 1-498, 1-499 or 1-500 of SEQ ID NO: 107.

13. A truncated PH20 hyaluronidase that consists of the sequence of amino acids set forth as amino acids 36-465, 36-484, 36-485, 36-486, 36-487, 36-488 or 36-489 of SEQ ID NO: 107, or contains amino acid substitutions in the sequence of amino acids set forth as amino acids 36-465, 36-484, 36-485, 36-486, 36-487, 36-488 or 36-489 of SEQ ID NO: 107, whereby the amino acid-substituted PH20 hyaluronidase consists of a sequence of amino acids that has at least 85%, 87%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more sequence identity with the sequence of amino acids set forth as amino acids 36-465, 36-484, 36-485, 36-486, 36-487, 36-488 or 36-489 of SEQ ID NO: 107.

14. A PH20 of claim 12 or claim 13 that is N-glycosylated, N-partially glycosylated or is deglycosylated.

15. A PH20 of any of claims 12-14 that is neutral active.

- 168 -

16. A truncated PH20 hyaluronidase glycoprotein that consists of the sequence of amino acids set forth in any of SEQ ID NOS: 55-106, or contains amino acid substitutions in the sequence of amino acids set forth in any of SEQ ID NOS: 55-106, whereby the amino acid-substituted PH20 hyaluronidase consists of a sequence
5 of amino acids that has at least 85%, 87%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more sequence identity with the sequence of amino acids set forth in any of SEQ ID NOS: 55-106, wherein the PH20 hyaluronidase glycoprotein is N-glycosylated but is not glycosylated at one or more amino acid residues corresponding to amino acid residues 82, 166 or 254 of SEQ ID NO: 107.
- 10 17. A PH20 of claim 16 that comprises at least an N-acetylglucosamine moiety linked to each of at least three asparagine (N) residues.
18. A PH20 of claim 17, wherein the three asparagine residues are amino acid residues 235, 368 and 393 of SEQ ID NO:107 or residues corresponding to amino acid residues 235, 368 and 393 of SEQ ID NO:107.
- 15 19. A PH20 of any of claims 16-18 that is neutral active.
20. A PH20 of any of claims 16-19 that is soluble.
21. A PH20 of any of claims 16-20, wherein the PH20 is selected from among human, chimpanzee, rhesus monkey and cynomolgus monkey.
22. An esPH20 or PH20 of any of claims 1-21 that is modified by
20 modification selected from among sialation, albumination, farnesylation, carboxylation, hydroxylation and phosphorylation.
23. An esPH20 or PH20 of any of claims 1-21 that is modified by a polymer.
24. An esPH20 or PH20 of claim 23, wherein the polymer is dextran or
25 PEG.
25. A PH20 hyaluronidase glycoprotein, comprising the sequence of amino acids set forth in SEQ ID NO: 107, or a truncated neutral active form thereof, or a sequence of amino acids that has at least 85%, 87%, 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more sequence identity with the sequence of amino
30 acids set forth in SEQ ID NO: 107 or truncated forms thereof, wherein the PH20 hyaluronidase glycoprotein is N-glycosylated but is not glycosylated at one or more

- 169 -

amino acid residues corresponding to amino acid residues 82, 166 or 254 of SEQ ID NO: 107.

26. An esPH20 or PH20 of any of claims 1-25, wherein the polypeptide is modified to have decreased immunogenicity in a human compared to the unmodified polypeptide.
27. The esPH20 or PH20 of claim 26, wherein the primary sequence is altered to eliminate epitopes that contribute to antigenicity.
28. An esPH20 or PH20 of any of claims 1-25, wherein the polypeptide is produced by expression in a host cell that does not bifucosylate the polypeptide.
29. The esPH20 or PH20 of claim 28, wherein the host cell is a mammalian host cell or a mammalianized insect cell expression system.
30. An esPH20 or PH20 of any of claims 1-25 that is not bifucosylated.
31. The esPH20 or PH20 of any of claims 1-30 that is substantially purified or isolated.
32. A conjugate, comprising the esPH20 or PH20 of any of claims 1-31.
33. A conjugate of claim 32, wherein the esPH20 or PH20 is conjugated to a moiety selected from among a multimerization domain, toxin, detectable label or drug.
34. A conjugate of claim 33, wherein the esPH20 or PH20 is conjugated to an Fc domain.
35. A conjugate of claim 32, wherein the esPH20 or PH20 is conjugated to a polymer.
36. A conjugate of claim 35, wherein the polymer is dextran or PEG.
37. A conjugate of any of claims 32-36, wherein the conjugated moiety is linked directly or via a linker to the C-terminus or N-terminus of the esPH20 or PH20.
38. A nucleic acid molecule encoding the esPH20 or PH20 of any of claims 1-21, wherein the nucleic acid molecule does not encode a full-length PH20 but encodes a truncated PH20 or encodes an esPH20.
39. An expression vector, comprising a polynucleotide that consists of the sequence of nucleotides encoding a PH20 or esPH20 of any of claims 1-21 each

- 170 -

including or immediately followed by a stop codon operatively inserted into the vector for expression of the PH20 or esPH20 of any of claims 1-21.

40. The nucleic acid molecule of claim 38 or claim 39 that encodes an esPH20 polypeptide that consists of amino acids of 36-491, 36-492, 36-493, 36-494,
5 36-495, 36-496, 36-497, 36-498, 36-499 or 36-500 of SEQ ID NO: 107; or a polypeptide that contains amino acid substitutions in the sequence of amino acids set forth as amino acids 36-491, 36-492, 36-493, 36-494, 36-495, 36-496, 36-497, 36-498, 36-499 or 36-500 of SEQ ID NO: 107, whereby the amino acid-substituted esPH20 polypeptide consists of a sequence of amino acids that has at least 85%, 87%,
10 90%, 91%, 92%, 93%, 94%, 95%, 96%, 97%, 98%, 99% or more sequence identity with the sequence of amino acids set forth as amino acids of 36-491, 36-492, 36-493, 36-494, 36-495, 36-496, 36-497, 36-498, 36-499 or 36-500 of SEQ ID NO: 107.

41. A nucleic acid molecule that is an expression vector, comprising a polynucleotide that consists of the sequence of nucleotides set forth in any of SEQ ID
15 NOS: 150-154, 200-201 and 213-215, or degenerates thereof and includes a stop codon to produce a truncated PH20 or esPH20 encoded by any of SEQ ID NOS: 150-154, 200-201 and 213-215, wherein the polynucleotide is operatively linked for expression to produce the encoded truncated PH20 or esPH20.

42. The nucleic acid of claim 38 that encodes an esPH20 that consists of
20 amino acids 36-491, 36-492, 36-493, 36-494, 36-495, 36-496, 36-497 or 36-498 of SEQ ID NO:107.

43. A vector, comprising the nucleic acid of any of claims 38, 40 and 42.

44. A cell, comprising a vector of claim 39 or 43 or a nucleic acid molecule of any of claims 38 and 40-42.

25 45. The cell of claim 44 that is a CHO cell.

46. A composition, comprising an esPH20 or PH20 polypeptide of any of claims 1-31.

47. A composition, comprising a plurality of esPH20 or PH20 polypeptides of any of claims 1-21.

30 48. A composition, comprising a plurality of esPH20 or PH20 polypeptides of any of claims 22-31.

- 171 -

49. The composition of claim 47, wherein the plurality of esPH20 polypeptides is encoded by a nucleic acid molecule of any of claims 38 and 40-42 or a vector of claim 39 or claim 43.

50. The composition of any of claims 46-49, wherein the esPH20 or PH20 polypeptides are secreted from CHO cells.

51. A composition of any of claims 46-50, that is a pharmaceutical composition.

52. A composition of claim 51 comprising an additional therapeutic agent.

53. The composition of claim 52, wherein the therapeutic agent is formulated with the composition or in a separate composition.

54. The composition of claim 52 or claim 53, wherein the therapeutic agent is selected from among a chemotherapeutic agent, an analgesic agent, an anti-inflammatory agent, an antimicrobial agent, an amoebicidal agent, a trichomonocidal agent, an anti-parkinson agent, an anti-malarial agent, an anticonvulsant agent, an anti-depressant agent, and antiarthritics agent, an anti-fungal agent, an antihypertensive agent, an antipyretic agent, an anti-parasite agent, an antihistamine agent, an alpha-adrenargic agonist agent, an alpha blocker agent, an anesthetic agent, a bronchial dilator agent, a biocide agent, a bactericide agent, a bacteriostat agent, a beta adrenergic blocker agent, a calcium channel blocker agent, a cardiovascular drug agent, a contraceptive agent, a decongestant agent, a diuretic agent, a depressant agent, a diagnostic agent, a electrolyte agent, a hypnotic agent, a hormone agent, a hyperglycemic agent, a muscle relaxant agent, a muscle contractant agent, an ophthalmic agent, a parasympathomimetic agent, a psychic energizer agent, a sedative agent, a sympathomimetic agent, a tranquilizer agent, an urinary agent, a vaginal agent, a viricide agent, a vitamin agent, a non-steroidal anti-inflammatory agent, an angiotensin converting enzyme inhibitor agent, a polypeptide, a protein, a nucleic acid, a drug, an organic molecule or a sleep inducer.

55. The composition of any of claims 52-54, wherein the therapeutic agent is selected from among an antibody, an immunoglobulin, a bisphosphonate, a cytokine, a chemotherapeutic agent and an insulin.

- 172 -

56. The composition of claim 55, wherein the insulin is a fast-acting insulin and the bisphosphonate is zoledronic acid.

57. A method for treating a hyaluronan-associated disease or condition, comprising administering to a subject an esPH20 or PH20 of any of claims 1-31 or a
5 composition of any of claims 46-56.

58. A method for treating an excess of glycosaminoglycans; for treating a tumor; for treating glycosaminoglycan accumulation in the brain; for treating a cardiovascular disorder; for treating an ophthalmic disorder; for treating pulmonary disease; for increasing penetration of chemotherapeutic agents into solid tumors; for
10 treating cellulite; for treating a proliferative disorder; or for increasing bioavailability of drugs and other therapeutic agents, comprising administering to a subject an esPH20 or PH20 of any of claims 1-31 or a composition of any of claims 46-56.

59. The method of claim 58, wherein the proliferative disorder is benign prostatic hyperplasia.

15 60. The method of claim 58, or the composition of any of claims 52-56, wherein the additional therapeutic agent is selected from among Acivicins; Aclarubicins; Acodazoles; Acronines; Adozelesins; Aldesleukins; Alemtuzumabs; Alitretinoins (9-Cis-Retinoic Acids); Allopurinols; Altretamines; Alvocidibs; Ambazones; Ambomycins; Ametantrones; Amifostines; Aminoglutethimides;
20 Amsacrine; Anastrozoles; Anaxirones; Ancitabines; Anthramycins; Apaziquones; Argimesnas; Arsenic Trioxides; Asparaginases; Asperlins; Atrimustines; Azacitidines; Azetepas; Azotomycins; Banoxantrones; Batabulins; Batimastats; BCG Live; Benaxibines; Bendamustines; Benzodepas; Bexarotenes; Bevacizumab; Bicalutamides; Bietaserpines; Biricodars; Bisantrones; Bisantrones; Bisnafide
25 Dimesylates; Bizelesins; Bleomycins; Bortezomibs; Brequinars; Bropirimines; Budotitanes; Busulfans; Cactinomycins; Calusterones; Canertinibs; Capecitabines; Caracemides; Carbetimers; Carboplatins; Carboquones; Carmofurs; Carmustines with Polifeprosans; Carmustines; Carubicins; Carzelesins; Cedefingols; Celecoxibs;
Cemadotins; Chlorambucils; Cirotionels; Cirolemycins; Cisplatin; Cladribines;
30 Clanfenurs; Clofarabines; Crisnatols; Cyclophosphamides; Cytarabine liposomals; Cytarabines; Dacarbazines; Dactinomycins; Darbepoetin Alfa; Daunorubicin

- 30 Xanthomycin A's (Guamecyclines); Zeniplatins; Zilascorb [2-H]; Zinostatin; Zoledronate; Zorubicins; and Zosuquidars.

- 175 -

61. The method of claim 59, wherein the PH20 or esPH20 is pegylated.
62. Use of an esPH20 or PH20 of any of claims 1-31 or a composition of any of claims 46-56 in the formulation of a medicament for treating a hyaluronan-associated disease or condition.
- 5 63. A pharmaceutical composition, comprising a polypeptide of any of claims 1-30 for treating a hyaluronan-associated disease or condition.
64. A pharmaceutical composition of any of claims 46-56 for treating a hyaluronan-associated disease or condition.
65. Use of an esPH20 or PH20 of any of claims 1-31 or a composition of
10 any of claims 46-56 for the formulation of a medicament for treating an excess of glycosaminoglycans; for treating a tumor; for treating glycosaminoglycan accumulation in the brain; for treating a cardiovascular disorder; for treating an ophthalmic disorder; for treating pulmonary disease; for increasing penetration of chemotherapeutic agents into solid tumors; for treating cellulite; for treating a
15 proliferative disorder; or for increasing bioavailability of drugs and other therapeutic agents.
66. The use of claim 65, wherein the proliferative disorder is benign prostatic hyperplasia.
67. A pharmaceutical composition, comprising a polypeptide of any of
20 claims 1-31, for use in treating an excess of glycosaminoglycans; for treating a tumor; for treating glycosaminoglycan accumulation in the brain; for treating a cardiovascular disorder; for treating an ophthalmic disorder; for treating pulmonary disease; for increasing penetration of chemotherapeutic agents into solid tumors; for treating cellulite; for treating a proliferative disorder; or for increasing bioavailability
25 of drugs and other therapeutic agents.
68. A pharmaceutical composition of any of claims 46-56 for use in treating an excess of glycosaminoglycans; for treating a tumor; for treating glycosaminoglycan accumulation in the brain; for treating a cardiovascular disorder; for treating an ophthalmic disorder; for treating pulmonary disease; for increasing
30 penetration of chemotherapeutic agents into solid tumors; for treating cellulite; for

- 176 -

treating a proliferative disorder; or for increasing bioavailability of drugs and other therapeutic agents.

69. The pharmaceutical composition of claim 67 or claim 68, wherein the proliferative disorder is benign prostatic hyperplasia.

INTERNATIONAL SEARCH REPORT

International application No
PCT/US2009/006501

A. CLASSIFICATION OF SUBJECT MATTER
INV. C12N9/26
ADD.

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)
C12N

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, BIOSIS, EMBASE, WPI Data, Sequence Search

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X Y	WO 2006/091871 A1 (HALOZYME THERAPEUTICS INC [US]; BOOKBINDER LOUIS H [US]; KUNDU ANIRBAN) 31 August 2006 (2006-08-31) see SEQ ID NO:1 and SEQ ID NO:4 abstract paragraph [0021] - paragraph [0027] paragraph [0047] - paragraph [0051] claims 1-21, 61, 63, 153; examples 4, 5 -& DATABASE Geneseq [Online] 2 November 2006 (2006-11-02), "Human hyaluronidase glycoprotein (sHASEGP) SEQ ID NO:4." ☒ Further documents are listed in the continuation of Box C.

☒ See patent family annex.

* Special categories of cited documents:

"A" document defining the general state of the art which is not considered to be of particular relevance

"E" earlier document but published on or after the international filing date

"L" document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)

"O" document referring to an oral disclosure, use, exhibition or other means

"P" document published prior to the international filing date but later than the priority date claimed

"T" later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

"X" document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

"Y" document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

"&" document member of the same patent family

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

judith.troilo@morganlewis.com
phpatentcorrespondence@morganlewis.com

DETAILED ACTION

Claims 1-23 are pending and under examination on their merits.

Notice of Pre-AIA or AIA Status

The present application is being examined under the pre-AIA first to invent provisions.

Claim Objections

Claim 23 is objected to because of the following informalities: "are identical to the residues an amino acid sequence selected from the group" (lines 6-7). The word "in" is missing between "residues" and "an amino acid sequence."

Claim Rejections - 35 USC § 112

The following is a quotation of 35 U.S.C. 112(b):

(b) CONCLUSION.—The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the inventor or a joint inventor regards as the invention.

The following is a quotation of 35 U.S.C. 112 (pre-AIA), second paragraph:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 1 and 4-23 are rejected under 35 U.S.C. 112(b) or 35 U.S.C. 112 (pre-AIA), second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which the inventor or a joint inventor (or for applications subject to pre-AIA 35 U.S.C. 112, the applicant), regards as the invention.

Claims 1 and 23 both recite "selected from among H, K, R, and S" (part (c) of claim 1 and part (c) of claim 23), which has multiple interpretations. In one interpretation, H, K, R, and S is a closed group, whereas in a second interpretation the

group is open. Therefore, claim 1 is indefinite. Applicant may obviate this rejection by amending to “selected from the group consisting of H, K, R, and S.”

Claim 8 suffers from a similar deficiency. Claim 8 recites “one or more modifications of the polypeptide selected from among glycosylation, sialylation, albumination, farnesylation, carboxylation, hydroxylation, and phosphorylation.” There are two possible interpretations of claim 8: the group is a closed group or an open group. Applicant may obviate this rejection by amending to “selected from the group consisting of glycosylation, sialylation, albumination, farnesylation, carboxylation, hydroxylation, and phosphorylation.”

Claims 4-22 are rejected for depending from a rejected base claim and not recertifying the sources of indefiniteness.

Claim 9, which depends from claim 8, requires that the polypeptide is glycosylated but this does not rectify the deficiency under 35 U.S.C. 112(b) because claim 8 recites “one or more modifications,” thus it is still unclear whether the modifications are selected from a closed group or an open group. Claim 10 also does not rectify the deficiency under 35 U.S.C. 112(b).

The following is a quotation of the first paragraph of 35 U.S.C. 112(a):

(a) IN GENERAL.—The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly connected, to make and use the same, and shall set forth the best mode contemplated by the inventor or joint inventor of carrying out the invention.

The following is a quotation of the first paragraph of pre-AIA 35 U.S.C. 112:

The specification shall contain a written description of the invention, and of the manner and process of making and using it, in such full, clear, concise, and exact terms as to enable any person skilled in the art to which it pertains, or with which it is most nearly

connected, to make and use the same, and shall set forth the best mode contemplated by the inventor of carrying out his invention.

Claims 21-22 are rejected under 35 U.S.C. 112(a) or 35 U.S.C. 112 (pre-AIA), first paragraph, as failing to comply with the enablement requirement. The claims contains subject matter which was not described in the specification in such a way as to enable one skilled in the art to which it pertains, or with which it is most nearly connected, to make and/or use the invention.

Per MPEP 2164.01(a), the following eight factors should be considered when determining whether the person of ordinary skill in the art would face undue experimentation to make and/or use the invention: (1) The nature of the invention; (2) the state of the prior art; (3) the relative skill of those in the art; (4) the predictability or unpredictability of the art; (5) the breadth of the claims; (6) the amount of direction or guidance presented; (7) the presence or absence of working examples; and (8) the quantity of experimentation necessary. While it is not essential that every factor be examined in detail, those factors deemed most relevant should be considered.

Nature of the invention. Claim 21 is drawn to a method for treating cancer comprising administering a modified PH20 polypeptide to a subject in need thereof. Claim 22 requires that administering is to a subject receiving treatment with an anticancer drug. Claim 21 depends from 15, which is drawn to a pharmaceutical composition comprising the modified PH20 polypeptide and a therapeutically active agent. Claim 15 ultimately depends from claim 1, which is drawn to a modified PH20 polypeptide comprising an amino acid sequence with at least 95% identity to an amino acid sequence selected from the group consisting of SEQ ID NO: 3 and 32-66 and a modification of H, K, R, or S at position 320.

Breadth of the claims. Claims 21-22 are broad because neither claim limits the type of cancer or the stage of cancer. Thus, the scope of claims 21-22 is the treatment of any cancer with the specific PH20 polypeptide recited in claim 1.

State of the prior art and unpredictability. Patel et al. (*Int. J. Cancer*. 97, 416–424 (2002); cited on the IDS filed on 3/8/2024) summarizes the state of the art as follows: elevated mRNA levels or increased hyaluronidase enzymatic activity have been associated with invasion and metastasis for ovarian and endometrial cancers, progression of prostate cancer, bladder cancer, colorectal carcinoma, laryngeal cancer and salivary gland tumors (Introduction paragraph 3). Thus, the person of ordinary skill in the art would not have predicted based on Patel that administering hyaluronidase would have treated cancer but rather that elevated hyaluronidase would have been a biomarker for certain cancers.

De Mayer et al. (*Int. J. Cancer*. 51,657-660 (1992); cited on the IDS filed on 3/8/2024) teaches that in vitro removal by hyaluronidase of the hyaluronan present in the extracellular matrix of tumor cells renders the latter more accessible to effector T cells (Abstract). De Mayer also teaches that mice with elevated levels of circulating hyaluronidase had decreased tumor growth rate and prolonged survival time for both 3LL lung carcinoma and B16F10 melanoma. De Mayer's teachings are limited to mice and two tumor types.

Bouga et al. (*BMC Cancer* 2010, 10:499; cited on the IDS filed on 3/8/2024) teaches that hyaluronidases are known to be involved in tumor growth but their exact role in tumor promotion or suppression is not clear (Abstract Background). Thus, Bouga suggests that there is unpredictability in the art. Bouga teaches that PH-20 activity is

higher in colon carcinoma samples (Abstract Background and Results). PH-20 is abundant in all extracts of all stages of cancer (Abstract Results). Bouga explains that production of HA is excessive in malignant cancers; increased HA serum levels and deposition in tumour tissue are often associated with malignant progression in colorectal cancer (page 2, left column, bottom paragraph).

Pham et al. (*CANCERRESEARCH* 57, 778-783, February 15, 1997; cited on the IDS filed on 3/8/2024) teaches that urinary hyaluronidase levels in patients with bladder cancer is elevated 5-8 fold higher than those in normal individuals (Abstract). The person of ordinary skill in the art would not have predicted based on Pham that administering a hyaluronidase (PH20) would have treated bladder cancer given that hyaluronidase levels were already elevated in patients with bladder cancer.

Therefore, the state of the art suggests that hyaluronidase activity is increased in some forms of cancer. However, the state of the art does not suggest predictability of success in treating cancer by administering the hyaluronidase PH20, or a modified polypeptide with the claimed amino acid modifications.

Guidance in the specification and working examples. The specification discloses that some cancers are hyaluronan-associated, wherein the HA amounts in the tissue, cell, or fluid are relatively elevated compared to a subject having a less severe cancer, such as an early stage, differentiated or other type of cancer (page 214 lines 1-3). The specification also discloses hyaluronan-rich tumors including non-small-cell lung cancer (NSCLC), breast cancer, colon cancer and pancreatic cancer (lines 19-20 on page 215). Therefore, the specification discloses that there are differences in the hyaluronan amounts depending on the stage of cancer and also the type of cancer. However, claim

21 is drawn to a method of treating cancer that encompasses all cancers, irrespective of the cancer type, the stage of cancer, or even whether the cancer is hyaluronan-associated.

The working examples provided in the specification include the screening of PH20 variants with altered hyaluronidase activity (see Example 4 on page 254), determination of enzymatic activity of PH20 (Example 8 on page 311), stability of PH20 variants (Examples 9-11), and in vivo pharmacokinetics of F204P-PH20 in mice (Table 31 on page 323). However, there are no working examples in the specification for treating any form of cancer with any PH20 variant.

Amount of experimentation necessary. The person of ordinary skill in the art would face undue experimentation to practice the full scope of the invention. The person of ordinary skill in the art would be required to determine which cancers (type and stage) the modified PH20 would have treated. To determine this would have required many experiments in both animal and human models on each and every possible cancer.

Taking these factors into account, undue experimentation would be required by one of ordinary skill in the art to practice the full scope of the claimed invention. Thus, the claims are not fully enabled by the disclosure.

Double Patenting

A rejection based on double patenting of the “same invention” type finds its support in the language of 35 U.S.C. 101 which states that “whoever invents or discovers any new and useful process... may obtain a patent therefor...” (Emphasis added). Thus, the term “same invention,” in this context, means an invention drawn to

identical subject matter. See *Miller v. Eagle Mfg. Co.*, 151 U.S. 186 (1894); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); *In re Ockert*, 245 F.2d 467, 114 USPQ 330 (CCPA 1957).

A statutory type (35 U.S.C. 101) double patenting rejection can be overcome by canceling or amending the claims that are directed to the same invention so they are no longer coextensive in scope. The filing of a terminal disclaimer cannot overcome a double patenting rejection based upon 35 U.S.C. 101.

Claims 1-20 and 23 are rejected under 35 U.S.C. 101 as claiming the same invention as that of **claims 1-21 of prior U.S. Patent No. 11,952,600 (hereafter '600)**. **This is a statutory double patenting rejection.**

Claims 1-20 require each and every limitation of claims 1-20 of '600, respectively.

Claim 23 requires each and every limitation of claim 21 of '600.

Therefore, claims 1-20 of the instant application are identical in scope to claims 1-20 and 23 of U.S. Patent No. 11,952,600.

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed.

Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on nonstatutory double patenting provided the reference application or patent either is shown to be commonly owned with the examined application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement. See MPEP § 717.02 for applications subject to examination under the first inventor to file provisions of the AIA as explained in MPEP § 2159. See MPEP § 2146 *et seq.* for applications not subject to examination under the first inventor to file provisions of the AIA. A terminal disclaimer must be signed in compliance with 37 CFR 1.321(b).

The filing of a terminal disclaimer by itself is not a complete reply to a nonstatutory double patenting (NSDP) rejection. A complete reply requires that the terminal disclaimer be accompanied by a reply requesting reconsideration of the prior Office action. Even where the NSDP rejection is provisional the reply must be complete. See MPEP § 804, subsection I.B.1. For a reply to a non-final Office action, see 37 CFR 1.111(a). For a reply to final Office action, see 37 CFR 1.113(c). A request for reconsideration while not provided for in 37 CFR 1.113(c) may be filed after final for consideration. See MPEP §§ 706.07(e) and 714.13.

The USPTO Internet website contains terminal disclaimer forms which may be used. Please visit www.uspto.gov/patent/patents-forms. The actual filing date of the application in which the form is filed determines what form (e.g., PTO/SB/25,

PTO/SB/26, PTO/AIA/25, or PTO/AIA/26) should be used. A web-based eTerminal Disclaimer may be filled out completely online using web-screens. An eTerminal Disclaimer that meets all requirements is auto-processed and approved immediately upon submission. For more information about eTerminal Disclaimers, refer to www.uspto.gov/patents/apply/applying-online/eterminal-disclaimer.

Claims 1, 6-10, and 14 are rejected on the ground of nonstatutory double patenting as being unpatentable over **claims 1-3, 7-8, 10, and 14 of U.S. Patent No. US 10,865,400** (hereafter '400).

The statutory prohibition on nonstatutory double patenting rejections under 35 U.S.C. 121 does not apply. U.S. Patent No. US 10,865,400 issued from U.S. Application No. 15/226,489, which is a divisional application of 13/694,731. The instant application is a divisional application of 16/912,590, which is a divisional application of 13/694,731. The instant claims are not consonant with the original restriction requirement mailed on 3/2/2015 in the file wrapper of 13/694,731. The restriction requirement mailed on 3/2/2015 required election between Groups III and IV. Group III was directed to a modified PH20 polypeptide having increased stability of being resistant to protein denaturation, wherein the modified polypeptide is made based on unmodified PH20 amino acid sequence consisting of SEQ ID NO: 7. Group IV was drawn to a modified PH20 polypeptide having increased hyaluronidase activity, wherein the modified polypeptide is made based on unmodified PH20 amino acid sequence consisting of SEQ ID NO: 7. Here, instant claim 1 is drawn to a modified PH20 polypeptide, wherein at least 95% of the residues of the amino acid sequence of the unmodified polypeptide

are identical to the residues in the amino acid sequence selected from the group consisting of SEQ ID NO: 3 and 32-66, which excludes SEQ ID NO: 7. Hence, The statutory prohibition on nonstatutory double patenting rejections under 35 U.S.C. 121 does not apply.

This rejection applies to the embodiment in which the modification at position 320 is a replacement of the amino acid residue at position 320 by H, K, or R.

Claim 1 of '400 is drawn to a modified PH20 polypeptide comprising one or more amino acid replacements in an unmodified PH20 polypeptide, wherein: the unmodified PH20 polypeptide consists of the amino acid sequence selected from the group consisting of SEQ ID NOs: 3, 7 and 32-66; the modified PH20 polypeptide exhibits increased hyaluronidase activity that is at least 120% of the hyaluronidase activity compared to the unmodified PH20 polypeptide not containing the amino acid replacements; wherein at least one amino acid replacement confers the increased hyaluronidase activity and is at position 320 (see line 61 of column 299) relative to SEQ ID NO: 3 and the modified polypeptide has at least 95% sequence identity to the amino acid sequence selected from the group consisting of SEQ ID NOs: 3, 7 and 32-66.

Claim 2 of '400 further limits the amino acid replacement to be selected from a group that includes H at position 320, K at position 320, and R at position 320 (see lines 36-39 in column 302).

Claim 3 of '400 requires that the modified PH20 polypeptide is a soluble PH20 polypeptide and the unmodified polypeptide consists of the amino acid sequence set forth in any of SEQ ID Nos: 3 or 32-66.

Claim 7 of '400 requires that the modified PH20 polypeptide of claim 1 comprises

one or more of a modification selected from among glycosylation, sialation, albumination, famesylation, carboxylation, hydroxylation and phosphorylation.

Claim 8 of '400 requires that modified PH20 polypeptide of claim 1 comprises at least an N-acetylglucosamine moiety linked to each of at least three asparagine (N) residues.

Claim 13 of '400 recites a pharmaceutical composition comprising the modified PH20 polypeptide of claim 1.

Instant claim 1 is unpatentable over claim 2 of '400 because both claims recite the amino acid replacement of H, K, or R at position 320 in the same base sequence (SEQ ID NOs: 3 and 32-66).

Instant claim 6 is unpatentable over claims 1-2 of '400. Instant claim 6 requires that the hyaluronidase activity of the modified PH20 polypeptide is at least 120% of the hyaluronidase activity of the PH20 polypeptide of SEQ ID NO: 3. Claim 2 of '400 depends from claim 1, which requires that the modified PH20 polypeptide exhibits increased hyaluronidase activity that is at least 120% of the hyaluronidase activity compared to the unmodified PH20 polypeptide. In one embodiment of claim 1 of '400, the unmodified PH20 polypeptide consists of the amino acid sequence of SEQ ID NO: 3.

Instant claim 7 is unpatentable over claim 3 of '400 since both claims require a modified PH20 that is soluble with the amino acid residue at position 320 replaced by H, K, or R and at least 95% similarity to SEQ ID NO: 3 or 32-66.

Instant claim 8 is unpatentable over claim 7 of '400, since both claims require that the modified PH20 polypeptide has a modification selected from among

glycosylation, sialation, albumination, famesylation, carboxylation, hydroxylation and phosphorylation.

Instant claim 9 is unpatentable over claim 7 of '400, since the modifications recited in claim 7 of '400 include glycosylation.

Instant claim 10 is unpatentable over claim 8 of '400 because both claims require a modified PH20 polypeptide that comprises at least an N-acetylglucosamine moiety linked to each of at least three asparagine (N) residues.

Instant claim 14 is unpatentable over claim 13 of '400 since it would have been obvious to one of ordinary skill in the art before the effective filing date of the claims to formulate the modified PH20 of claim 2 of '400 as a pharmaceutical composition as well.

Claims 1, 6-14, and 23 are rejected on the ground of nonstatutory double patenting as being unpatentable over **claims 1-3, 7-8, 10, and 14 of U.S. Patent No. US 10,865,400** (hereafter '400) **in view of Bookbinder et al. (WO2010/077297).**

See discussion of '400 above, which is incorporated into this rejection as well.

Regarding instant claim 11, claims 1-3, 7-8, 10, and 14 of '400 do not recite a nucleic acid encoding the modified PH20 polypeptide.

Regarding instant claim 12, claims 1-3, 7-8, 10, and 14 of '400 do not recite a recombinant expression vector comprising the nucleic acid encoding the modified PH20 polypeptide.

Regarding instant claim 13, claims 1-3, 7-8, 10, and 14 of '400 do not recite a host cell comprising the vector comprising the nucleic acid encoding the modified PH20 polypeptide.

Bookbinder teaches soluble PH20 polypeptides (Abstract). Bookbinder teaches a nucleic acid molecule encoding a PH20 (Bookbinder claim 38), a vector comprising the nucleic acid (Bookbinder claim 43), and a cell comprising the vector (claim 44).

It would have been obvious to a person of ordinary skill in the art before the effective filing date of the claims to express the PH20 polypeptides of claims 1-3, 7-8, 10, and 14 of '400 from a nucleic acid. It would have been further obvious to contain the nucleic acid in a vector and transfect a cell with the vector. One of ordinary skill in the art would have been motivated to produce the modified PH20 polypeptides of '886 per the teachings of Bookbinder. One of ordinary skill in the art would have had a reasonable expectation of success given that Bookbinder successfully expressed a PH20 polypeptide using the same recombinant techniques.

Regarding instant claim 23, claims 1-3, 7-8, 10, and 14 of '400 do not recite a method of manufacture of a protein comprising preparing a plasmid DNA containing a cDNA encoding the protein comprising an amino acid sequence, transfecting the plasmid into a host cell, culturing the cell under conditions for expression of the cDNA as a protein, and harvesting the protein from the culture.

Bookbinder teaches that PH20 may be recombinantly produced by transfecting recombinant molecules such as a plasmid into a host cell (lines 10-11 on page 64; line 25 page 63) and purifying (harvesting) the protein (line 17 on page 63). Cells transfected with the vector are cultured in chemically defined medium (lines 14-15 on page 69). The expressed soluble PH20 polypeptide is secreted into the culture medium (lines 21-22 on page 41).

It would have been obvious to a person of ordinary skill in the art before the effective filing date of the claims to apply Bookbinder's method for manufacturing a protein to the modified PH20 polypeptide of claims 1-3, 7-8, 10, and 14 of '400. One of ordinary skill in the art would have been motivated to produce a PH20 polypeptide with increased hyaluronidase activity. One of ordinary skill in the art would have had a reasonable expectation of success given that Bookbinder was already successful in recombinantly producing a PH20 polypeptide.

Claims 1-5, 7-9, 14-20 are provisionally rejected on the ground of nonstatutory double patenting as being unpatentable over **claims 1-2, 4-6, 13-14, 17-19, 24, 27-28, 30, and 37-38 of copending Application No. 18/064,886** (reference application; hereafter '886).

This is a provisional nonstatutory double patenting rejection because the patentably indistinct claims have not in fact been patented.

Note that the reference application has the same patent filing term date as the application, 12/28/2012. This rejection will therefore be maintained until it is overcome, even if it is the final outstanding issue. See MPEP 804(I)(B)(1)(a); 804(I)(B)(1)(b)(ii).

Claim 1 of '886 recites a modified PH20 polypeptide comprising one or more amino acid modifications in an unmodified PH20 polypeptide, wherein the unmodified PH20 polypeptide consists of the amino acid sequence selected from the group consisting of SEQ ID NOs: 3, 7 and 32-66, amino acid modifications are selected from the group consisting of amino acid replacements, deletions, and/or insertions, the modified PH20 polypeptide comprises an amino acid replacement at a position

corresponding to residue 320, with reference to amino acid positions set forth in SEQ ID NO: 3; the replacement at the position corresponding to residue 320 is selected from the group consisting of H, K, R, and S, corresponding amino acid positions are relative to SEQ ID NO: 3 at positions relative to SEQ ID NO: 3, and the modified PH20 polypeptide has at least 91% sequence identity to a polypeptide having the amino acid sequence selected from the group consisting of SEQ ID NO: 3, 7, and 32-66.

Claim 2 of '866 requires that the modified PH20 polypeptide has at least 95% sequence identity to the amino acid sequence selected from the group consisting of SEQ ID NOs: 3, 7 and 32-66.

Claim 4 of '866 requires that the modified PH20 polypeptide of claim 1 exhibits increased hyaluronidase activity compared to the unmodified PH20 polypeptide not containing the amino acid replacement at position 320.

Claim 5 of '866 requires that the modified PH20 polypeptide is soluble.

Claim 6 of '866 requires that replacement in the modified PH20 polypeptide is K at position 320.

Claim 13 of '866 requires that the unmodified PH20 polypeptide consists of the amino acid sequence of SEQ ID NO: 35 and the residue at position 320 in the modified PH20 polypeptide is K.

Claim 14 of '866 requires that the unmodified PH20 polypeptide consists of the amino acid sequence of SEQ ID NO: 32 and the residue at position 320 in the modified PH20 polypeptide is K.

Claim 17 of '866 requires that the modified PH20 polypeptide comprises one or post-translational modifications selected from the group consisting of glycosylation,

sialylation, albumination, farnesylation, carboxylation, hydroxylation, and phosphorylation.

Claim 18 of '866 requires that the modified PH20 polypeptide is glycosylated.

Claim 19 of '866 requires that the polypeptide is a glycoprotein that comprises an N-acetylglucosamine moiety linked to each of the at least three asparagine residues.

Claim 24 of '866 recites a pharmaceutical composition comprising the modified PH20 polypeptide of claim 1.

Claim 27 of '866 recites that the pharmaceutical composition of claim 24 further comprising a therapeutically active agent formulated in the same composition or in a separate composition.

Claim 28 of '866 recites the pharmaceutical composition of claim 27 wherein the therapeutically active agent is a polypeptide, a protein, a nucleic acid, a drug, a small molecule or an organic molecule.

Claim 30 of '866 recites the pharmaceutical composition of claim 27, wherein the therapeutically active agent is an antibody.

Claim 37 of '866 is drawn to a method for increasing delivery of a therapeutic agent to a subject comprising administering a modified PH20 polypeptide of claim 1 to the subject and administering a therapeutic agent, wherein the modified PH20 polypeptide and the therapeutic agent are administered in separate compositions or in the same composition.

Claim 38 of '866 limits administration of the therapeutic agent and the PH20 polypeptide to subcutaneous administration.

Instant claim 1 is unpatentable over claims 1-2 of '886 because instant claim 1 requires that the modified PH20 polypeptide is at least 95% identical to the residues in an amino acid sequence selected from the group consisting of SEQ ID NO: 3 and 32-66, which overlaps with the group recited in claims 1-2 of '866 (SEQ ID NO: 3, 7, and 32-66).

Instant claim 2 is unpatentable over claim 6 of '866 because both claims require the same replacement (K at position 320).

Instant claim 3 is unpatentable over claim 13 of '866 because both claims require the amino acid residue at position 320 in the modified PH20 polypeptide is K. Claim 13 of '866 depends from claim 1 of '866, which requires that the modified PH20 polypeptide has at least 91% sequence identity to a polypeptide having the amino acid sequence selected from the group consisting of SEQ ID NO: 3, 7, and 32-66. Instant claim 3 requires that at least 96% of the residues of the amino acid sequence of the modified PH20 polypeptide are identical to the residues in the amino acid sequence set forth in SEQ ID NO: 35, which overlaps with the embodiment of claim 13 of '866 in which the modified PH20 polypeptide has at least 91% sequence identity to a polypeptide having the amino acid sequence set forth by SEQ ID NO: 35.

Instant claim 4 is unpatentable over claim 14 of '866 because both claims require the residue at position 320 in the modified PH20 polypeptide is K. Claim 14 of '866 depends from claim 1 of '866, which requires that the modified PH20 polypeptide has at least 91% sequence identity to a polypeptide having the amino acid sequence selected from the group consisting of SEQ ID NO: 3, 7, and 32-66. Instant claim 4 requires that at least 95% of the residues of the amino acid sequence of the modified PH20 polypeptide are identical to the residues in the amino acid sequence set forth in SEQ ID

NO: 32, which overlaps with the embodiment of claim 14 of '866 in which the modified PH20 polypeptide has at least 91% sequence identity to a polypeptide having the amino acid sequence set forth by SEQ ID NO: 32.

Instant claim 5 is unpatentable over claim 4 of '886 because both claims require that the modified PH20 has increased hyaluronidase activity compared to the hyaluronidase activity of the polypeptide set forth in SEQ ID NO: 3.

Instant claim 7 is unpatentable over claim 5 of '866 because both claims require that the modified PH20 polypeptide is soluble.

Instant claim 8 is unpatentable over claim 17 of '866 because the same modifications of the modified PH20 polypeptide are required in both claims.

Instant claim 9 is unpatentable over claim 18 of '866 because both claims require that the modified PH20 polypeptide is glycosylated.

Instant claim 14 is unpatentable over claim 24 of '866 because both claims are drawn to a pharmaceutical composition comprising the modified PH20 polypeptide.

Instant claim 15 is unpatentable over claim 27 because both claims are directed to a pharmaceutical composition comprising the modified PH20 polypeptide and a therapeutically active agent.

Instant claim 16 is unpatentable over claim 28 of '866 because both claims recite the same list of therapeutically active agents.

Instant claim 17 is unpatentable over claim 30 of '866 because both claims limit the therapeutically active agent in the pharmaceutical composition to an antibody.

Instant claim 18 is unpatentable over claim 28 of '866 because a small molecule drug is one of the choices for the therapeutically active agent in claim 28 of '866.

Instant claims 19-20 are unpatentable over claims 37-38 of '866. Claim 38 of '866 is drawn to a method of administering the modified PH20 polypeptide and the therapeutic agent subcutaneously, which is a form of parenteral (non-oral) administration.

Claims 1-5, 7-9, 11-20, and 23 are provisionally rejected on the ground of nonstatutory double patenting as being unpatentable over **claims 1-2, 4-6, 13-14, 17-19, 24, 27-28, 30, and 37-38 of copending Application No. 18/064,886** (reference application; hereafter '886) **in view of Bookbinder et al. (WO 2010/077297 A1)**.

See discussion of '886 above, which is incorporated into this rejection as well.

Regarding instant claim 11, claims 1-2, 4, 6, 17-18, 24, 27-28, 30, and 37-38 of '886 do not recite a nucleic acid encoding the modified PH20 polypeptide.

Regarding instant claim 12, claims 1-2, 4, 6, 17-18, 24, 27-28, 30, and 37-38 of '886 do not recite a recombinant expression vector comprising the nucleic acid encoding the modified PH20 polypeptide.

Regarding instant claim 13, claims 1-2, 4, 6, 17-18, 24, 27-28, 30, and 37-38 of '886 do not recite a host cell comprising the vector comprising the nucleic acid encoding the modified PH20 polypeptide.

Bookbinder teaches soluble PH20 polypeptides (Abstract). Bookbinder teaches a nucleic acid molecule encoding a PH20 (Bookbinder claim 38), a vector comprising the nucleic acid (Bookbinder claim 43), and a cell comprising the vector (claim 44).

It would have been obvious to a person of ordinary skill in the art before the effective filing date of the claims to express the PH20 polypeptides of claims 1-2, 4, 6,

17-18, 24, 27-28, 30, and 37-38 of '886 from a nucleic acid. It would have been further obvious to contain the nucleic acid in a vector and transfect a cell with the vector. One of ordinary skill in the art would have been motivated to produce the modified PH20 polypeptides of '886 per the teachings of Bookbinder. One of ordinary skill in the art would have had a reasonable expectation of success given that Bookbinder successfully expressed a PH20 polypeptide using the recombinant techniques.

Regarding instant claim 23, claims 1-2, 4, 6, 17-18, 24, 27-28, 30, and 37-38 of '886 do not recite a method of manufacture of a protein comprising preparing a plasmid DNA containing a cDNA encoding the protein comprising an amino acid sequence, transfecting the plasmid into a host cell, culturing the cell under conditions for expression of the cDNA as a protein, and harvesting the protein from the culture.

Bookbinder teaches that PH20 may be recombinantly produced by transfecting recombinant molecules such as a plasmid into a host cell (lines 10-11 on page 64; line 25 page 63) and purifying (harvesting) the protein (line 17 on page 63). Cells transfected with the vector are cultured in chemically defined medium (lines 14-15 on page 69). The expressed soluble PH20 polypeptide is secreted into the culture medium (lines 21-22 on page 41).

It would have been obvious to a person of ordinary skill in the art before the effective filing date of the claims to apply Bookbinder's method for manufacturing a protein to the modified PH20 polypeptide of claims 1-2, 4, 6, 17-18, 24, 27-28, 30, and 37-38 of '886. One of ordinary skill in the art would have been motivated to produce a PH20 polypeptide with increased hyaluronidase activity. One of ordinary skill in the art

would have had a reasonable expectation of success given that Bookbinder was already successful in recombinantly producing a PH20 polypeptide.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to CANDICE LEE SWIFT whose telephone number is (571)272-0177. The examiner can normally be reached M-F 8:00 AM-4:30 PM (Eastern).

Examiner interviews are available via telephone, in-person, and video conferencing using a USPTO supplied web-based collaboration tool. To schedule an interview, applicant is encouraged to use the USPTO Automated Interview Request (AIR) at <http://www.uspto.gov/interviewpractice>.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Louise Humphrey can be reached on (571)272-5543. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of published or unpublished applications may be obtained from Patent Center. Unpublished application information in Patent Center is available to registered users. To file and manage patent submissions in Patent Center, visit: <https://patentcenter.uspto.gov>. Visit <https://www.uspto.gov/patents/apply/patent-center> for more information about Patent Center and <https://www.uspto.gov/patents/docx> for information about filing in DOCX format. For additional questions, contact the Electronic Business Center (EBC) at 866-217-9197

Examiner, Art Unit 1657

United States Patent and Trademark Office

Office of the Commissioner for Patents

Dear Applicant,

You recently received an Office action from your examiner. Review of your patent application is under way! You can continue to advertise or mark any products covered by your application for your invention as "Patent Pending" for as long as this application is pending. This letter provides information about how to continue through the patent application process and the help available to you on your journey.

Where are you in the patent application process? Your patent application is now in step 3, Application Prosecution (www.uspto.gov/UtilityPatentGuide.) Though the Office action includes a "rejection," that does not mean that you don't have a good idea you can patent. It means your examiner believes your application is not yet ready for allowance.

Ready to respond? Responding to the Office action is your opportunity to address the issues raised by your examiner. Responses must be timely, complete, and in writing. In your response, you may want to consider amending your application (www.uspto.gov/patents/maintain/responding-office-actions).

We provide Pro Se Assistance, support specifically geared for independent inventors without an agent or attorney. Visit www.uspto.gov/ProSePatents for a consolidated list of resources, including a sample amendment format. Full description of amendment formatting can be found at www.uspto.gov/web/offices/pac/mpep/s714.html. Call us at 866-767-3848, or email proseassistancecenter@uspto.gov.

Have questions about the Office action? Contact your examiner! A conversation with your examiner (called an "interview") may help clarify and resolve any issues and possibly identify what you can patent. While an interview does not stop the clock for your official response or substitute for a response, there is no fee for an interview. To schedule a call or video, you can:

1. use the USPTO's Automated Interview Request (AIR) form (www.uspto.gov/patents/uspto-automated-interview-request-air-form);
2. file the Applicant Initiated Interview Request form (PTOL-413A) (www.uspto.gov/sites/default/files/documents/PTOL413A.pdf); or
3. contact your examiner directly via telephone (contact information is provided at the end of your Office action).

Need help near you? We have regional offices across the country (www.uspto.gov/locations), as well as Patent and Trademark Resource Centers in libraries in nearly every state (www.uspto.gov/ptrc), with specialists standing by to help you at no cost.

Become a registered electronic filer (registered eFiler). As a registered eFiler, you can electronically view your submission, track progress of your application, and respond to USPTO correspondence. (www.uspto.gov/NewPatentFilers)

DETAILED ACTION

The non-final action mailed on 5/14/2024 is vacated and replaced with this action.

Claims 1-23 are canceled. Claims 24-34 are pending and under examination on their merits.

Notice of Pre-AIA or AIA Status

The present application is being examined under the pre-AIA first to invent provisions.

Claim Rejections - 35 USC § 112

The following is a quotation of 35 U.S.C. 112(b):

(b) CONCLUSION.—The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the inventor or a joint inventor regards as the invention.

The following is a quotation of 35 U.S.C. 112 (pre-AIA), second paragraph:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 24 and 26-34 are rejected under 35 U.S.C. 112(b) or 35 U.S.C. 112 (pre-AIA), second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which the inventor or a joint inventor (or for applications subject to pre-AIA 35 U.S.C. 112, the applicant), regards as the invention.

Claim 24 recites “selected from among H, K, R, and S” (part (b) iii, which has multiple interpretations. In one interpretation, H, K, R, and S is a closed group, whereas in a second interpretation the group is open. Therefore, claim 24 is indefinite. Applicant

may obviate this rejection by amending to “selected from the group consisting of H, K, R, and S.”

Claims 26-34 are rejected for depending from a rejected base claim and not rectifying the sources of indefiniteness.

Double Patenting

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the “right to exclude” granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on nonstatutory double patenting provided the reference application or patent either is shown to be commonly owned with the examined application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement. See MPEP § 717.02 for applications subject to examination under the first inventor to file

provisions of the AIA as explained in MPEP § 2159. See MPEP § 2146 *et seq.* for applications not subject to examination under the first inventor to file provisions of the AIA. A terminal disclaimer must be signed in compliance with 37 CFR 1.321(b).

The filing of a terminal disclaimer by itself is not a complete reply to a nonstatutory double patenting (NSDP) rejection. A complete reply requires that the terminal disclaimer be accompanied by a reply requesting reconsideration of the prior Office action. Even where the NSDP rejection is provisional the reply must be complete. See MPEP § 804, subsection I.B.1. For a reply to a non-final Office action, see 37 CFR 1.111(a). For a reply to final Office action, see 37 CFR 1.113(c). A request for reconsideration while not provided for in 37 CFR 1.113(c) may be filed after final for consideration. See MPEP §§ 706.07(e) and 714.13.

The USPTO Internet website contains terminal disclaimer forms which may be used. Please visit www.uspto.gov/patent/patents-forms. The actual filing date of the application in which the form is filed determines what form (e.g., PTO/SB/25, PTO/SB/26, PTO/AIA/25, or PTO/AIA/26) should be used. A web-based eTerminal Disclaimer may be filled out completely online using web-screens. An eTerminal Disclaimer that meets all requirements is auto-processed and approved immediately upon submission. For more information about eTerminal Disclaimers, refer to www.uspto.gov/patents/apply/applying-online/eterminal-disclaimer.

Claims 24-30 and 32-34 are rejected on the ground of nonstatutory double patenting as being unpatentable over **claims 1-3, 10, and 13 of U.S. Patent No. US 10,865,400 (hereafter '400) in view of Bookbinder et al. (US 7,767,429 B2).**

The statutory prohibition on nonstatutory double patenting rejections under 35 U.S.C. 121 does not apply. U.S. Patent No. US 10,865,400 issued from U.S. Application No. 15/226,489, which is a divisional application of 13/694,731. The instant application is a divisional application of 16/912,590, which is a divisional application of 13/694,731. The instant claims are not consonant with the original restriction requirement mailed on 3/2/2015 in the file wrapper of 13/694,731. The restriction requirement mailed on 3/2/2015 required election between Groups III and IV. Group III was directed to a modified PH20 polypeptide having increased stability of being resistant to protein denaturation, wherein the modified polypeptide is made based on unmodified PH20 amino acid sequence consisting of SEQ ID NO: 7. Group IV was drawn to a modified PH20 polypeptide having increased hyaluronidase activity, wherein the modified polypeptide is made based on unmodified PH20 amino acid sequence consisting of SEQ ID NO: 7. Here, instant claim 24 is drawn to a method for increasing delivery requiring a modified PH20 polypeptide, wherein at least 95% of the residues of the amino acid sequence of the unmodified polypeptide are identical to the residues in the amino acid sequence selected from the group consisting of SEQ ID NO: 3 and 32-66, which excludes SEQ ID NO: 7. Hence, the statutory prohibition on nonstatutory double patenting rejections under 35 U.S.C. 121 does not apply.

This rejection applies to the embodiment in which the modification at position 320 is a replacement of the amino acid residue at position 320 by H, K, or R.

Claim 1 of '400 is drawn to a modified PH20 polypeptide comprising one or more amino acid replacements in an unmodified PH20 polypeptide, wherein: the unmodified PH20 polypeptide consists of the amino acid sequence selected from the group

consisting of SEQ ID NOs: 3, 7 and 32-66; the modified PH20 polypeptide exhibits increased hyaluronidase activity that is at least 120% of the hyaluronidase activity compared to the unmodified PH20 polypeptide not containing the amino acid replacements; wherein at least one amino acid replacement confers the increased hyaluronidase activity and is at position 320 (see line 61 of column 299) relative to SEQ ID NO: 3 and the modified polypeptide has at least 95% sequence identity to the amino acid sequence selected from the group consisting of SEQ ID NOs: 3, 7 and 32-66.

Claim 2 of '400 further limits the amino acid replacement to be selected from a group that includes H at position 320, K at position 320, and R at position 320 (see lines 36-39 in column 302).

Claim 3 of '400 requires that the modified PH20 polypeptide is a soluble PH20 polypeptide and the unmodified polypeptide consists of the amino acid sequence set forth in any of SEQ ID Nos: 3 or 32-66.

Claim 13 of '400 recites a pharmaceutical composition comprising the modified PH20 polypeptide of claim 1.

Claims 1-3, 10, and 13 of '400 do not recite a method for increasing delivery of a therapeutic agent to a subject comprising administering to a subject a pharmaceutical composition comprising a therapeutic agent and a modified PH20 polypeptide.

Bookbinder teaches human soluble PH20 hyaluronidase glycoproteins or sHASEGPs (column 3, lines 51-54). Bookbinder teaches that subcutaneous administration of molecules in the presence of sHASEGP's facilitates their rapid systemic distribution (column 8, lines 30-33). Bookbinder teaches that sHASEGPs open channels in the interstitial space through degradation of glycosaminoglycans (column 8,

lines 2-5) and that these channels facilitate the diffusion of small molecules, proteins, and nucleic acids less than 500 nm in size (column 8, lines 6-10). Bookbinder teaches further that temporary removal of glycosaminoglycans enhances the delivery of drugs into interstitial spaces, which facilitates diffusion of therapeutic molecules and proteins (column 8, lines 26-30).

It would have been obvious to a person of ordinary skill in the art before the effective filing date of the claimed invention to administer the modified PH20 polypeptide of claims 1-3, 10, and 13 of '400 in combination with Bookbinder's therapeutic molecule to increase delivery of the therapeutic molecule. The person of ordinary skill in the art would have had a reasonable expectation of success given that Bookbinder taught that soluble hyaluronidase facilitated diffusion of small molecules, proteins, and nucleic acids and the modified PH20 of claims 1-3, 10, and 13 of '400 was both soluble (see claim 3 of '400) and exhibited hyaluronidase activity (see claim 1 of '400).

Instant claim 24 is unpatentable over claim 2 of '400 in view of Bookbinder because both claims recite the amino acid replacement of H, K, or R at position 320 in the same base sequence (SEQ ID NOs: 3 and 32-66).

Instant claim 25 is also unpatentable over claim 2 of '400 in view of Bookbinder because the amino acid replacement K at position 320 is recited in claim 2 of '400.

Instant claim 26 is unpatentable over claim 2 of '400 in view of Bookbinder because claim 2 of '400 depends from claim 1 of '400, which requires that the modified PH20 polypeptide has at least 95% sequence identity to the amino acid sequence selected from the group consisting of SEQ ID NOs: 3, 7, and 32-66. At least 95%

identity overlaps with at least 96% identity. Therefore, a prima facie case of obviousness exists. See MPEP 2144.05.

Instant claim 27 is unpatentable over claim 3 of '400 in view of Bookbinder because both claims require a modified PH20 that is soluble with the amino acid residue at position 320 replaced by H, K, or R and at least 95% similarity to SEQ ID NO: 3 or 32-66.

Instant claim 28 is unpatentable over claims 1-2 of '400. In one embodiment of claim 1 of '400, the modified PH20 polypeptide exhibits increased activity relative to SEQ ID NO: 3 (see column 299 lines 39-43). Claim 2 of '400, which depends from claim 1 of '400, recites the amino acid replacement H, K, or R at position 320 (see column 302, lines 36-39).

Instant claim 29 is unpatentable over claims 1-2 of '400 in view of Bookbinder. Instant claim 29 requires that the hyaluronidase activity of the modified PH20 polypeptide is at least 120% of the hyaluronidase activity of the PH20 polypeptide of SEQ ID NO: 3. Claim 2 of '400 depends from claim 1 of '400, which requires that the modified PH20 polypeptide exhibits increased hyaluronidase activity that is at least 120% of the hyaluronidase activity compared to the unmodified PH20 polypeptide. In one embodiment of claim 1 of '400, the unmodified PH20 polypeptide consists of the amino acid sequence of SEQ ID NO: 3.

Regarding instant claim 30, claims 1-3, 10, and 13 of '400 do not recite that the therapeutically active agent is a polypeptide, a protein, a nucleic acid, a drug, a small molecule, or an organic molecule. Bookbinder taught that PH20 increased delivery of small molecules, proteins, and nucleic acids less than 500 nm in size (column 8, lines 6-

10). Therefore, it would have been obvious to administer the modified PH20 of claims 1-3, 10, and 13 of '400 in combination with Bookbinder's therapeutic agents (small molecules, proteins, or nucleic acids) in order to increase delivery and the person of ordinary skill in the art would have had a reasonable expectation of success in doing so.

Regarding instant claim 32, claims 1-3, 10, and 13 of '400 do not recite that the therapeutically active agent is a small molecule drug.

Bookbinder suggests that soluble hyaluronidase increases delivery of small molecules (column 8, lines 6-10).

Therefore, it would have been obvious to the person of ordinary skill in the art before the effective filing date of the instant invention to administer a pharmaceutical composition comprising a small molecule drug and the modified PH20 polypeptide of '400 in order to increase delivery and the person of ordinary skill in the art would have had a reasonable expectation of success in doing so.

Regarding instant claim 33, claims 1-3, 10, and 13 of '400 do not recite that the pharmaceutical composition is administered to the patient parenterally. Regarding claim 34, claims 1-3, 10, and 13 of '400 do not recite that the pharmaceutical composition is administered to the patient subcutaneously.

Bookbinder suggests subcutaneous administration of molecules in the presence of sHASEGP (soluble neutral active Hyaluronidase Glycoproteins, wherein the hyaluronidase includes PH20, see column 3, lines 58-62) facilitates their systemic distribution more rapidly (column 8, lines 25-32). Therefore, it would have been obvious to the person of ordinary skill in the art before the effective filing date of the instant invention to administer the pharmaceutical composition of claim 13 of '400

subcutaneously, which is a form of parenteral (non-oral) administration. The person of ordinary skill in the art would have had a reasonable expectation of success in doing so given Bookbinder's teaching.

Claim 31 is rejected on the ground of nonstatutory double patenting as being unpatentable over **claims 1-3, 10, and 13 of U.S. Patent No. US 10,865,400 (hereafter '400) in view of Bookbinder et al. (US 7,767,429 B2)**, as applied to claims 24-30 and 32-34 above, and as evidenced by Reth (*Nat Immunol* 14, 765–767 (2013)).

See discussion of claims 1-3, 10, and 13 of '400 and Bookbinder above, which is incorporated into this rejection as well.

Regarding instant claim 31, claims 1-3, 10, and 13 of '400 do not recite that the therapeutically active agent is an antibody. However, the person of ordinary skill in the art would have recognized that antibodies are less than 500 nm in size, as evidenced by Reth (see page 765, second column, top paragraph: "The real size of an antibody molecule is about 10 nm"). Therefore, the person of ordinary skill in the art would have had a reasonable expectation of success in increasing delivery of an antibody in combination with the modified PH20 polypeptide of claims 1-3, 10, and 13 of '400.

Claims 24-30 and 32-34 are rejected on the ground of nonstatutory double patenting as being unpatentable over **claims 1-21 of U.S. Patent No. 11,952,600 (hereafter '600) in view of Bookbinder et al. (US 7,767,429 B2)**.

The statutory prohibition on nonstatutory double patenting rejections under 35 U.S.C. 121 does not apply. U.S. Patent No. 11,952,600 issued from 18/338,189. The

instant application is a divisional application of 18/338,189. No restriction requirement was made in 18/338,189.

Claim 1 of '600 is drawn to a modified PH20 polypeptide with an amino acid sequence at least 95% identical to an amino acid sequence selected from the group consisting of SEQ ID NO: 3 and 32-66, wherein the amino acid sequence of the modified PH20 polypeptide contains the amino acid replacement of H, K, R, and S at position 320 relative to SEQ ID NO: 3.

Claim 2 of '600 requires that the amino acid replacement is K at position 320 relative to SEQ ID NO: 3.

Claim 3 of '600 requires at least 95% of the residues of the amino acid sequence of the modified PH20 polypeptide are identical to SEQ ID NO: 35.

Claim 4 of '600 requires that at least 95% of the residues of the amino acid sequence of the modified PH20 polypeptide are identical to SEQ ID NO: 32.

Claim 5 of '600 requires that the modified PH20 polypeptide exhibits increased hyaluronidase activity compared to SEQ ID NO: 3 under identical conditions.

Claim 6 of '600 requires that the modified PH20 polypeptide has at least 120% activity compared to SEQ ID NO: 3.

Claim 7 of '600 recites that the modified PH20 polypeptide is soluble.

Claim 8 of '600 requires that the modified PH20 polypeptide comprises one or more modifications including glycosylation. Claim 9 of '600 requires that the modified PH20 polypeptide is glycosylated. Claim 10 of '600 requires that the polypeptide is a glycoprotein comprising an N-acetyl-glucosamine moiety linked to each of at least three asparagine residues.

Claim 11 of '600 is drawn to a nucleic acid encoding the modified PH20 polypeptide. Claim 12 of '600 is drawn to a recombinant expression vector comprising the nucleic acid. Claim 13 of '600 is drawn to a host cell comprising the vector.

Claim 14 of '600 is drawn to a pharmaceutical composition comprising the modified PH20 polypeptide.

Claim 15 of '600 is drawn to a pharmaceutical composition comprising a therapeutically active agent and the modified PH20 polypeptide. Claim 16 of '600 is drawn to a pharmaceutical composition wherein the therapeutically active agent is a polypeptide, a protein, a nucleic acid, a drug, a small molecule, or an organic molecule. Claim 17 of '600 limits the therapeutically active agent to an antibody. Claim 18 of '600 is drawn to a pharmaceutical composition comprising a small molecule drug.

Claim 19 of '600 recites a method for administering a therapeutically active agent comprising providing a pharmaceutical composition and parenterally administering the composition. Claim 20 of '600 requires subcutaneously administering the pharmaceutical composition.

Claim 21 is drawn to a method of manufacturing the modified PH20 polypeptide.

Claims 1-21 of '600 do not recite a method for increasing delivery of a therapeutic agent to a subject comprising administering to a subject a pharmaceutical composition comprising a therapeutic agent and a modified PH20 polypeptide.

Bookbinder teaches human soluble PH20 hyaluronidase glycoproteins or sHASEGPs (column 3, lines 51-54). Bookbinder teaches that subcutaneous administration of molecules in the presence of sHASEGP's facilitates their rapid systemic distribution (column 8, lines 30-33). Bookbinder teaches that sHASEGPs open

channels in the interstitial space through degradation of glycosaminoglycans (column 8, lines 2-5) and that these channels facilitate the diffusion of small molecules, proteins, and nucleic acids less than 500 nm in size (column 8, lines 6-10). Bookbinder teaches further that temporary removal of glycosaminoglycans enhances the delivery of drugs into interstitial spaces, which facilitates diffusion of therapeutic molecules and proteins (column 8, lines 26-30).

It would have been obvious to a person of ordinary skill in the art before the effective filing date of the claimed invention to administer the modified PH20 hyaluronidase of claims 1-21 of '600 in combination with Bookbinder's therapeutically active agent in order to increase delivery of the therapeutic agent. The person of ordinary skill in the art would have had a reasonable expectation of success given that Bookbinder taught that soluble hyaluronidase facilitated diffusion of small molecules, proteins, and nucleic acids (column 8, lines 6-10).

Instant claim 25 is unpatentable over claim 2 of '600 in view of Bookbinder.

Instant claim 26 is unpatentable over claim 3 of '600 in view of Bookbinder.

Instant claim 27 is unpatentable over claim 4 of '600 in view of Bookbinder.

Instant claim 28 is unpatentable over claim 5 of '600 in view of Bookbinder.

Instant claim 29 is unpatentable over claim 6 of '600 in view of Bookbinder.

Instant claim 30 is unpatentable over claims 1, 14-16 and 19 of '600 in view of Bookbinder because claim 19 of '600 is drawn to a method of administering the pharmaceutical composition comprising a therapeutically active agent and the modified PH20 polypeptide. Since the therapeutically active agent would have been a protein a nucleic acid, a drug, a small molecule, or an organic molecule (see claim 16 of '600),

the person of ordinary skill in the art would have had a reasonable expectation of success in increasing delivery of the therapeutically active agent given Bookbinder's teaching that soluble hyaluronidase facilitated diffusion.

Regarding instant claim 32, claims 16 and 18 of '600 recite a pharmaceutical composition comprising a small molecule drug and a modified PH20 polypeptide but do not recite a method for increasing delivery of the small molecule drug.

It would have been obvious to a person of ordinary skill in the art before the effective filing date of the claimed invention to administer the pharmaceutical composition of claims 16 or 18 of '600 comprising a small molecule drug and a modified PH20 polypeptide in order to increase delivery of the small molecule drug given Bookbinder's suggestion that soluble hyaluronidase facilitated diffusion of small molecules (Bookbinder column 8, lines 6-10). The person of ordinary skill in the art would have had a reasonable expectation of success given Bookbinder's teaching.

Instant claim 33 is unpatentable over claims 19-20 of '600 in view of Bookbinder because claims 19-20 of '600 are both methods of parenteral administration.

Instant claim 34 is unpatentable over claim 20 of '600 in view of Bookbinder because claim 20 is limited to subcutaneous administration.

Claim 31 is rejected on the ground of nonstatutory double patenting as being unpatentable over **claims 1-21 of U.S. Patent No. 11,952,600 (hereafter '600) in view of Bookbinder et al. (US 7,767,429 B2)**, as applied to claims 24-30 and 32-34 above, and as evidenced by Reth (*Nat Immunol* 14, 765–767 (2013)).

See discussion of claims 1-21 of '600 and Bookbinder above, which is incorporated into this rejection as well.

Regarding instant claim 31, claims 16 and 18 of '600 do not recite that the therapeutically active agent is an antibody. However, the person of ordinary skill in the art would have recognized that antibodies are less than 500 nm in size, as evidenced by Reth (see page 765, second column, top paragraph: "The real size of an antibody molecule is about 10 nm"). Therefore, the person of ordinary skill in the art would have had a reasonable expectation of success in increasing delivery of an antibody in combination with the modified PH20 polypeptide of claims 16 and 18 of '600.

Claims 24-28 and 30-34 are provisionally rejected on the ground of nonstatutory double patenting as being unpatentable over **claims 1-2, 4, 6, 13-14, 24, 27-28, 30, and 37-41 of copending Application No. 18/064,886** (reference application; hereafter '886).

This is a provisional nonstatutory double patenting rejection because the patentably indistinct claims have not in fact been patented.

Note that the reference application has the same patent filing term date as the application, 12/28/2012. This rejection will therefore be maintained until it is overcome, even if it is the final outstanding issue. See MPEP 804(I)(B)(1)(a); 804(I)(B)(1)(b)(ii).

The statutory prohibition on nonstatutory double patenting rejections under 35 U.S.C. 121 does not apply. The instant application is a divisional application of 16/912,590. The reference application 18/064,886 is also a divisional application of 16/912,590. There was a restriction requirement mailed 10/15/2020 in the file wrapper

of 16/912,590. However, the restriction requirement is between a modified PH20 polypeptide with aspartic acid (Asp) at position 320 (see species election section of the restriction requirement and SEQ ID NO: 576-586) and a method for increased delivery of the modified PH20 polypeptide. Therefore, the instant claims, which require a modified PH20 polypeptide with H, K, R, or S at position 320 relative to SEQ ID NO: 3, are not consonant with the restriction requirement in 16/912,590. Hence, the statutory prohibition on nonstatutory double patenting rejections under 35 U.S.C. 121 does not apply.

Claim 1 of '886 recites a modified PH20 polypeptide comprising one or more amino acid modifications in an unmodified PH20 polypeptide, wherein the unmodified PH20 polypeptide consists of the amino acid sequence selected from the group consisting of SEQ ID NOs: 3, 7 and 32-66, amino acid modifications are selected from the group consisting of amino acid replacements, deletions, and/or insertions, the modified PH20 polypeptide comprises an amino acid replacement at a position corresponding to residue 320, with reference to amino acid positions set forth in SEQ ID NO: 3; the replacement at the position corresponding to residue 320 is selected from the group consisting of H, K, R, and S, corresponding amino acid positions are relative to SEQ ID NO: 3, and the modified PH20 polypeptide has at least 91% sequence identity to a polypeptide having the amino acid sequence selected from the group consisting of SEQ ID NO: 3, 7, and 32-66.

Claim 2 of '866 requires that the modified PH20 polypeptide has at least 95% sequence identity to the amino acid sequence selected from the group consisting of SEQ ID NOs: 3, 7 and 32-66.

Claim 4 of '866 requires that the modified PH20 polypeptide of claim 1 exhibits increased hyaluronidase activity compared to the unmodified PH20 polypeptide not containing the amino acid replacement at position 320.

Claim 6 of '866 requires that replacement in the modified PH20 polypeptide is K at position 320.

Claim 13 of '866 requires that the unmodified PH20 polypeptide consists of the amino acid sequence of SEQ ID NO: 35 and the residue at position 320 in the modified PH20 polypeptide is K.

Claim 14 of '866 requires that the unmodified PH20 polypeptide consists of the amino acid sequence of SEQ ID NO: 32 and the residue at position 320 in the modified PH20 polypeptide is K.

Claim 24 of '866 recites a pharmaceutical composition comprising the modified PH20 polypeptide of claim 1.

Claim 27 of '866 recites that the pharmaceutical composition of claim 24 further comprises a therapeutically active agent formulated in the same composition or in a separate composition.

Claim 28 of '866 recites the pharmaceutical composition of claim 27 wherein the therapeutically active agent is a polypeptide, a protein, a nucleic acid, a drug, a small molecule or an organic molecule.

Claim 30 of '866 recites the pharmaceutical composition of claim 27, wherein the therapeutically active agent is an antibody.

Claim 37 of '866 is drawn to a method for increasing delivery of a therapeutic agent to a subject comprising administering a modified PH20 polypeptide of claim 1 to

the subject and administering a therapeutic agent, wherein the modified PH20 polypeptide and the therapeutic agent are administered in separate compositions or in the same composition.

Claim 38 of '866 limits administration of the therapeutic agent and the PH20 polypeptide to subcutaneous administration.

Claim 39 of '866 requires that the administration of the therapeutic agent and PH20 polypeptide is administered before the therapeutic agent.

Claim 40 of '866 limits the therapeutic agent to an antibody.

Claim 41 of '866 requires that the modified PH20 polypeptide and the therapeutic agent are administered in the same composition.

Instant claim 24 is unpatentable over claims 1-2 and 37 of 886 because instant claim 24 requires that the modified PH20 polypeptide is at least 95% to the residues in an amino acid sequence selected from the group consisting of SEQ ID NO: 3 and 32-66, which overlaps with the group recited in claims 1-2 of '866 (SEQ ID NO: 3, 7, and 32-66). Both instant claim 24 and claim 1 of '866 require an amino acid replacement of H, K, R, or S at residue 320 with reference to amino acid positions set forth in SEQ ID NO: 3.

Instant claim 25 is unpatentable over claims 1-2, 6 and 37 of '866 because the claims require the same replacement (K at position 320).

Instant claim 26 is unpatentable over claims 13 and 37 of '866 because claim 13 of '866 requires that the unmodified PH20 polypeptide consists of the amino acid sequence of SEQ ID NO: 35. Claim 13 of '866 ultimately depends from claim 1 of '866, which requires that the modified PH20 polypeptide has at least 91% sequence identity

to a polypeptide having the amino acid sequence selected from the group consisting of SQ ID NO: 3, 7, and 32-66. At least 91% sequence identity overlaps with at least 95% identity. Therefore, a prima facie case of obviousness exists. See MPEP 2144.05.

Instant claim 27 is unpatentable over claims 14 and 37 of '866 because claim 14 of '866 requires that the unmodified PH20 polypeptide consists of the amino acid sequence of SEQ ID NO: 32. Claim 14 of '866 ultimately depends from claim 1 of '866, which requires that the modified PH20 polypeptide has at least 91% sequence identity to a polypeptide having the amino acid sequence selected from the group consisting of SQ ID NO: 3, 7, and 32-66. At least 91% sequence identity overlaps with at least 95% identity. Therefore, a prima facie case of obviousness exists. See MPEP 2144.05.

Instant claim 28 is unpatentable over claims 1, 4, and 37 of '866 because the claims require that the modified PH20 polypeptide exhibits increased hyaluronidase activity compared to the unmodified PH20 polypeptide not containing the amino acid replacement at position 320.

Instant claim 30 is unpatentable over claims 28 and 37 of '866 because the claims recite the same list of therapeutically active agents.

Instant claim 31 is unpatentable over claims 30 and 37 of '866 because the claims limit the therapeutically active agent in the pharmaceutical composition to an antibody.

Instant claim 32 is unpatentable over claims 28 and 37 of '866 because a small molecule drug is one of the choices for the therapeutically active agent in claim 28 of '866.

Instant claims 33-34 are unpatentable over claims 37-38 of '866. Claim 38 of '866 is drawn to a method of administering the modified PH20 polypeptide and the therapeutic agent subcutaneously, which is a form of parenteral (non-oral) administration.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to CANDICE LEE SWIFT whose telephone number is (571)272-0177. The examiner can normally be reached M-F 8:00 AM-4:30 PM (Eastern).

Examiner interviews are available via telephone, in-person, and video conferencing using a USPTO supplied web-based collaboration tool. To schedule an interview, applicant is encouraged to use the USPTO Automated Interview Request (AIR) at <http://www.uspto.gov/interviewpractice>.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Louise Humphrey can be reached on (571)272-5543. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

This collection of information is required by 37 CFR 1.16. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 12 minutes to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. **SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

If you need assistance in completing the form, call 1-800-PTO-9199 and select option 2.

AMENDMENT UNDER 37 C.F.R. § 1.111

In response to the Office Action dated 06/07/2024, Applicant requests entry of the following amendments and remarks. This response is considered timely filed. To the extent any additional fee is due, the Director is hereby authorized to charge additional fees which may be required, or credit any overpayment, to Deposit Account No. 50-0310.

Listing of the Claims begin on page 2 of this paper.

Remarks begin on page 5 of this paper.

AMENDMENTS TO CLAIMS

This Listing of Claims will replace all prior versions.

1- 23. (Cancelled)

24. (Currently amended) A method for increasing delivery of a therapeutic agent to a subject, comprising administering to a subject a pharmaceutical composition comprising:

(a) a therapeutic agent; and

(b) a modified PH20 polypeptide comprising an amino acid sequence, wherein:

- i. at least 95% of the residues of the amino acid sequence of the modified PH20 polypeptide are identical to the residues in an amino acid sequence selected from the group consisting of SEQ ID NOs: 3 and 32-66 when the sequence of the modified PH20 polypeptide is aligned at positions corresponding to the sequence selected from the group consisting of SEQ ID NOs: 3 and 32-66 to maximize identical residues; and
- ii. the amino acid sequence of the modified PH20 polypeptide comprises an amino acid modification at a position corresponding to position 320 with reference to amino acid positions set forth in SEQ ID NO: 3; and
- iii. the modification at position 320 is a replacement selected from ~~among the group consisting of~~ H, K, and S.

25. (Previously presented) The method of Claim 24, wherein the amino acid modification is at a position corresponding to position 320 with reference to amino acid positions set forth in SEQ ID NO: 3 is K.

26. (Previously presented) The method of Claim 25, wherein at least 96% of the residues of the amino acid sequence of the modified PH20 polypeptide are identical to the residues in an amino acid sequence set forth in SEQ ID NO:35.

27. (Previously presented) The method of Claim 25, wherein at least 95% of the residues of the amino acid sequence of the modified PH20 polypeptide are identical to the residues in an amino acid sequence set forth in SEQ ID NO:32.

28. (Previously presented) The method of Claim 24, wherein the modified PH20 polypeptide exhibits increased hyaluronidase activity compared to the hyaluronidase activity of the polypeptide set forth in SEQ ID NO: 3, measured under identical conditions.

29. (Previously presented) The method of Claim 24, wherein the hyaluronidase activity of the modified PH20 polypeptide is at least 120% of the hyaluronidase activity of the PH20 polypeptide of SEQ ID NO: 3, measured under identical condition.
30. (Previously presented) The method of Claim 24, wherein the therapeutically active agent is a polypeptide, a protein, a nucleic acid, a drug, a small molecule, or an organic molecule.
31. (Previously presented) The method of Claim 24, wherein the therapeutically active agent is an antibody.
32. (Previously presented) The method of Claim 24, wherein the therapeutically active agent is a small molecule drug.
33. (Previously presented) The method of Claim 24, wherein the pharmaceutical composition is administered to the patient parenterally.
34. (Previously presented) The method of Claim 24, wherein the pharmaceutical composition is administered to the patient subcutaneously.

REMARKS

Claims 24-34 are pending in this application of which claim 24 is independent. Claim 24 has been amended herein for formality. Applicant submits that no prohibited new matter has been added by way of the amendments.

The arguments and contentions presented in the Office Action should not be construed as any acquiescence or agreement by Applicant with the stated reasoning therein regardless of whether or not the following remarks specifically address any particular argument or contention from the Office Action. Furthermore, although certain distinctions between the claims of the present application and the cited references are addressed below, these distinctions are not necessarily exhaustive.

Rejection under 35 U.S.C. § 112

Claims 24 and 26-34 are rejected under 35 U.S.C. § 112, second paragraph (pre-AIA) as allegedly being indefinite as set forth in the Office Action at p. 2. Without acquiescing to the propriety of the rejection, and solely in an effort to expedite prosecution, Applicant has amended claim 24 in accordance with the Examiner's suggestions. Withdrawal of the rejection is requested in view of the amendment.

Double Patenting Rejections

Claims 24-30, 32-34 are rejected on the ground of non-statutory double patenting as being unpatentable over claims 1-3, 10, and 13 of U.S. Patent No. 10,865,400 (the '400 Patent) in view of US Patent No. 7,767,429 ("Bookbinder") as set forth in the Office Action at p. 4-10.

Claim 31 is rejected on the ground of non-statutory double patenting as being unpatentable over claims 1-3, 10, and 13 of U.S. Patent No. 10,865,400 (the '400 Patent) in view of US Patent No. 7,767,429 ("Bookbinder") and as evidenced by *Nat. Immunol.* 14, 765-767 (2013) ("Reth"), as set forth in the Office Action at p. 10.

Claims 24-30, 32-34 are rejected on the ground of non-statutory double patenting as being unpatentable over claims 1-21, 10, and 13 of U.S. Patent No. 11,952,600 (the '600 Patent) in view of US Patent No. 7,767,429 ("Bookbinder") as set forth in the Office Action at p. 10-14.

Claim 31 is rejected on the ground of non-statutory double patenting as being unpatentable over claims 1-21 of U.S. Patent No. 11,952,600 (the '6400 Patent) in view of US Patent No. 7,767,429 ("Bookbinder") and as evidenced by Reth, as set forth in the Office Action at p. 14-15.

Claims 24-28 and 30-34 provisionally rejected on the ground of non-statutory double patenting as being unpatentable over claims 1, 2, 4, 6, 13, 14, 24, 27, 28, 30 and 37-41 of co-pending Application No. 18/064,886 (the '886 application), as set forth in Office Action at p. 15-20.

Applicant herewith submits a terminal disclaimer obviating the double patenting rejections over the '400 Patent, the '600 Patent and the '886 application. Withdrawal of the double patenting rejections is requested in view of the terminal disclaimer.

Conclusion

The foregoing amendments and remarks are being submitted to place the subject application in condition for allowance. Should an interview be helpful to further prosecution of this application, the Examiner is invited to telephone the undersigned.

Respectfully submitted,

MORGAN LEWIS & BOCKIUS LLP

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

PH20 POLYPEPTIDE VARIANTS, FORMULATIONS AND USES THEREOF

Filing of terminal disclaimer does not obviate requirement for response under 37 CFR 1.111 to outstanding Office Action

This electronic Terminal Disclaimer is not being used for a Joint Research Agreement.

Owner	Percent interest
Halozyne, Inc.	100%
Total	100%

The owner(s) of percent interest listed above in the instant application hereby disclaims, except as provided below, the terminal part of the statutory term of any patent granted on the instant application which would extend beyond the expiration date of the full statutory term of any patent granted on pending reference Application Number(s)

Application #	Filing Date
18064886	12/12/2022

as the term of any patent granted on said reference application may be shortened by any terminal disclaimer filed prior to the grant of any patent on the pending reference application. The owner hereby agrees that any patent so granted on the instant application shall be enforceable only for and during such period that it and any patent

granted on the reference application are commonly owned. This agreement runs with any patent granted on the instant application and is binding upon the grantee, its successors or assigns.

In making the above disclaimer, the owner does not disclaim the terminal part of any patent granted on the instant application that would extend to the expiration date of the full statutory term of any patent granted on said reference application, "as the term of any patent granted on said reference application may be shortened by any terminal disclaimer filed prior to the grant of any patent on the pending reference application," in the event that any such patent granted on the pending reference application: expires for failure to pay a maintenance fee, is held unenforceable, is found invalid by a court of competent jurisdiction, is statutorily disclaimed in whole or terminally disclaimed under 37 CFR 1.321, has all claims canceled by a reexamination certificate, is reissued, or is in any manner terminated prior to the expiration of its full statutory term as shortened by any terminal disclaimer filed prior to its grant.

The owner(s) of percent interest listed above in the instant application hereby disclaims, except as provided below, the terminal part of the statutory term of any patent granted on the instant application which would extend beyond the expiration date of the full statutory term of prior patent number(s)

Patent #
10865400
11952600

as the term of said prior patent is presently shortened by any terminal disclaimer. The owner hereby agrees that any patent so granted on the instant application shall be enforceable only for and during such period that it and the prior patent are commonly owned. This agreement runs with any patent granted on the instant application and is binding upon the grantee, its successors or assigns.

In making the above disclaimer, the owner does not disclaim the terminal part of the term of any patent granted on the instant application that would extend to the expiration date of the full statutory term of the prior patent, "as the term of said prior patent is presently shortened by any terminal disclaimer," in the event that said prior patent later:

- expires for failure to pay a maintenance fee;
- is held unenforceable;
- is found invalid by a court of competent jurisdiction;
- is statutorily disclaimed in whole or terminally disclaimed under 37 CFR 1.321;
- has all claims canceled by a reexamination certificate;
- is reissued; or
- is in any manner terminated prior to the expiration of its full statutory term as presently shortened by any terminal disclaimer.

Terminal disclaimer fee under 37 CFR 1.20(d) included with Electronic Terminal Disclaimer request.

Applicant claims the following entity status:

Regular Undiscounted

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

I certify, in accordance with 37 CFR 1.4(d)(4) that I am: An attorney or agent registered to practice before the Patent and Trademark Office who is of record in this application

Signature	Name	Registration #
/Kalpesh V. Upadhye/	Kalpesh Upadhye	70236

* Statement under 37 CFR 3.73(b) is required if terminal disclaimer is signed by the assignee (owner). Form PTO/SB/96 may be used for making this certification. See MPEP 324.

NOTICE OF PUBLICATION OF APPLICATION

The above-identified application will be electronically published as a patent application publication pursuant to 37 CFR 1.211, et seq. The patent application publication number and publication date are set forth above.

The publication may be viewed using the USPTO's publicly available Searchable Databases via the Patent Public Search tool at www.uspto.gov. The direct link to access the Patent Public Search tool is currently <https://ppubs.uspto.gov/pubwebapp/static/pages/ppubsbasic.html>.

The publication process established by the Office does not provide for mailing a copy of the publication to applicant. A copy of the publication may be obtained from the Office upon payment of the appropriate fee set forth in 37 CFR 1.19(a)(1). Orders for copies of patent application publications are handled by the USPTO's Public Records Division. The Public Records Division can be reached by telephone at (571) 272-3150 or (800) 972-6382, by facsimile at (571) 273-3250, by mail addressed to the United States Patent and Trademark Office, Public Records Division, Alexandria, VA 22313-1450 or via the Internet.

In addition, information on the status of the application, including the mailing date of Office actions and the dates of receipt of correspondence filed in the Office, may also be accessed via the Internet through Patent Center, the USPTO's electronic patent application filing and management system. The direct link to access this status information is currently <https://patentcenter.uspto.gov/>. Prior to publication, such status information is confidential and may only be obtained by applicant using the private side of Patent Center.

Further assistance in electronically accessing the publication, or about Patent Center, is available by calling the Patent Electronic Business Center at 1-866-217-9197.

<i>Examiner-Initiated Interview Summary</i>	Application No. 18/599,428	Applicant(s) WEI et al.		
	Examiner CANDICE L SWIFT	Art Unit 1657	AIA (First Inventor to File) Status No	Page 1 of 1

All Participants (applicant, applicants representative, PTO personnel)	Title	Type
CANDICE L SWIFT	Examiner	Telephonic
Louise Humphrey	SPE	
Robert Smyth	Attorney of Record	
Kalpesh Upadhye	Attorney of Record	

Date of Interview: 28 June 2024

Issues Discussed:

Non-statutory Double Patenting

In order to expedite prosecution, the examiner made several calls to request that Applicant file a terminal disclaimer over 18/659,215 so that a notice of allowance could be mailed. Calls were made to Robert Smyth on 6/28, 7/1, 7/2, and 7/3, with voicemails left on 6/28 and 7/2. No response was received. Attorney Kalpesh Upadhye was called on 7/8 and a voicemail was left. As of 7/9, no response was received.

/CANDICE LEE SWIFT/ Examiner, Art Unit 1657	/LOUISE W HUMPHREY/ Supervisory Patent Examiner, Art Unit 1657
<p>Applicant is reminded that a complete written statement as to the substance of the interview must be made of record in the application file. It is the applicants responsibility to provide the written statement, unless the interview was initiated by the Examiner and the Examiner has indicated that a written summary will be provided. See MPEP 713.04</p> <p>Please further see: MPEP 713.04 Title 37 Code of Federal Regulations (CFR) § 1.133 Interviews, paragraph (b) 37 CFR § 1.2 Business to be transacted in writing</p>	

Applicant recordation instructions: It is not necessary for applicant to provide a separate record of the substance of interview.

Examiner recordation instructions: Examiners must summarize the substance of any interview of record. A complete and proper recordation of the substance of an interview should include the items listed in MPEP 713.04 for complete and proper recordation including the identification of the general thrust of each argument or issue discussed, a general indication of any other pertinent matters discussed regarding patentability and the general results or outcome of the interview, to include an indication as to whether or not agreement was reached on the issues raised.

NOTICE OF PUBLICATION OF APPLICATION

The above-identified application will be electronically published as a patent application publication pursuant to 37 CFR 1.211, et seq. The patent application publication number and publication date are set forth above.

The publication may be viewed using the USPTO's publicly available Searchable Databases via the Patent Public Search tool at www.uspto.gov. The direct link to access the Patent Public Search tool is currently <https://ppubs.uspto.gov/pubwebapp/static/pages/ppubsbasic.html>.

The publication process established by the Office does not provide for mailing a copy of the publication to applicant. A copy of the publication may be obtained from the Office upon payment of the appropriate fee set forth in 37 CFR 1.19(a)(1). Orders for copies of patent application publications are handled by the USPTO's Public Records Division. The Public Records Division can be reached by telephone at (571) 272-3150 or (800) 972-6382, by facsimile at (571) 273-3250, by mail addressed to the United States Patent and Trademark Office, Public Records Division, Alexandria, VA 22313-1450 or via the Internet.

In addition, information on the status of the application, including the mailing date of Office actions and the dates of receipt of correspondence filed in the Office, may also be accessed via the Internet through Patent Center, the USPTO's electronic patent application filing and management system. The direct link to access this status information is currently <https://patentcenter.uspto.gov/>. Prior to publication, such status information is confidential and may only be obtained by applicant using the private side of Patent Center.

Further assistance in electronically accessing the publication, or about Patent Center, is available by calling the Patent Electronic Business Center at 1-866-217-9197.

Notice of Pre-AIA or AIA Status

The present application is being examined under the pre-AIA first to invent provisions.

DETAILED ACTION

Claims 24-34 are pending and under examination on their merits.

The nonstatutory double patenting rejections made over U.S. Patent No. 10,865,400 and U.S. Patent No. 11,952,600 are withdrawn in view of approval of Applicant's electronic Terminal Disclaimer.

New obviousness-type nonstatutory double patenting rejections are made over Application No. 18/659,215. This action is non-final.

No arguments were presented to consider in the reply filed on 6/17/2024 that are relevant to the rejections made in this action.

Claim Objections

Claim 24 is objected to because of the following informalities: there is a space missing between "R" and "and" (see "Rand" in line 2 of part iii.). Appropriate correction is required.

Claim Rejections - 35 USC § 112

The following is a quotation of 35 U.S.C. 112(b):

(b) CONCLUSION.—The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the inventor or a joint inventor regards as the invention.

The following is a quotation of 35 U.S.C. 112 (pre-AIA), second paragraph:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 30-32 rejected under 35 U.S.C. 112(b) or 35 U.S.C. 112 (pre-AIA), second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which the inventor or a joint inventor (or for applications subject to pre-AIA 35 U.S.C. 112, the applicant), regards as the invention.

Claims 30-32 recite the limitation "therapeutically active agent" in line 1. There is insufficient antecedent basis for this limitation in each of these claims because they each depend from claim 24, which recites "therapeutic agent." This difference in drafting between the dependent claims and the independent claim leads to ambiguity in the scope of the dependent claims.

Double Patenting

The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*,

686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on nonstatutory double patenting provided the reference application or patent either is shown to be commonly owned with the examined application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement. See MPEP § 717.02 for applications subject to examination under the first inventor to file provisions of the AIA as explained in MPEP § 2159. See MPEP § 2146 *et seq.* for applications not subject to examination under the first inventor to file provisions of the AIA. A terminal disclaimer must be signed in compliance with 37 CFR 1.321(b).

The filing of a terminal disclaimer by itself is not a complete reply to a nonstatutory double patenting (NSDP) rejection. A complete reply requires that the terminal disclaimer be accompanied by a reply requesting reconsideration of the prior Office action. Even where the NSDP rejection is provisional the reply must be complete. See MPEP § 804, subsection I.B.1. For a reply to a non-final Office action, see 37 CFR 1.111(a). For a reply to final Office action, see 37 CFR 1.113(c). A request for reconsideration while not provided for in 37 CFR 1.113(c) may be filed after final for consideration. See MPEP §§ 706.07(e) and 714.13.

The USPTO Internet website contains terminal disclaimer forms which may be used. Please visit www.uspto.gov/patent/patents-forms. The actual filing date of the application in which the form is filed determines what form (e.g., PTO/SB/25, PTO/SB/26, PTO/AIA/25, or PTO/AIA/26) should be used. A web-based eTerminal

Disclaimer may be filled out completely online using web-screens. An eTerminal Disclaimer that meets all requirements is auto-processed and approved immediately upon submission. For more information about eTerminal Disclaimers, refer to www.uspto.gov/patents/apply/applying-online/eterminal-disclaimer.

Claims 24-25, 28-30, and 32-34 are provisionally rejected on the ground of nonstatutory double patenting as being unpatentable over claims 24-40 of copending Application No. **18/659,215** (hereafter '215) in view of **Bookbinder** et al. (US 7,767,429 B2; PTO-892 filed 5/14/2024).

This is a provisional nonstatutory double patenting rejection.

Note that the reference application has the same patent filing term date as the application, 08/02/2016. This rejection will therefore be maintained until it is overcome, even if it is the final outstanding issue. See MPEP 804(I)(B)(1)(a); 804(I)(B)(1)b(ii).

The statutory prohibition on nonstatutory double patenting rejections under 35 U.S.C. 121 does not apply because Application No. 18/659,215 is not a divisional application. Rather, Application No. 18/659,215 is a continuation of 18/340,482.

This rejection applies to the embodiment in which the modification at position 320 is H, K, R, or S with reference to amino acid positions set forth in SEQ ID NO: 3.

Claim 24 of '215 is drawn to a modified PH20 polypeptide comprising a soluble human PH20 polypeptide comprising a modification at position aligned to position 320 with reference to the amino acid positions set forth in SEQ ID NO: 3 after alignment with SEQ DI NO: 3 to maximize the number of identical residues, wherein the modification at position 320 is a replacement selected from the group consisting of H, K, R, and S.

Claims 24-40 of '215 do not recite a method for increasing delivery of a therapeutic agent to a subject comprising administering to a subject a pharmaceutical composition comprising a therapeutic agent and a modified PH20 polypeptide.

Bookbinder teaches human soluble PH20 hyaluronidase glycoproteins or sHASEGPs (column 3, lines 51-54). Bookbinder teaches that subcutaneous administration of molecules in the presence of sHASEGP's facilitates their rapid systemic distribution (column 8, lines 30-33). Bookbinder teaches that sHASEGPs open channels in the interstitial space through degradation of glycosaminoglycans (column 8, lines 2-5) and that these channels facilitate the diffusion of small molecules, proteins, and nucleic acids less than 500 nm in size (column 8, lines 6-10). Bookbinder teaches further that temporary removal of glycosaminoglycans enhances the delivery of drugs into interstitial spaces, which facilitates diffusion of therapeutic molecules and proteins (column 8, lines 26-30).

It would have been obvious to a person of ordinary skill in the art before the effective filing date of the claimed invention to administer the modified PH20 polypeptide of claims 24-40 of '215 in combination with Bookbinder's therapeutic molecule to increase delivery of the therapeutic molecule. The person of ordinary skill in the art would have had a reasonable expectation of success given that Bookbinder taught that soluble hyaluronidase facilitated diffusion of small molecules, proteins, and nucleic acids and the modified PH20 of claims 24-40 of '215 was both soluble (see claim 24 of '215) and exhibited hyaluronidase activity (see claim 26 of '215).

Instant claim 24 is unpatentable over claim 24 of '215 in view of Bookbinder because both claims recite the amino acid replacement of H, K, R, or S at position 320 in the same base sequence (SEQ ID NO: 3).

Instant claim 25 is also unpatentable over claim 25 of '215 in view of Bookbinder.

Instant claim 28 is unpatentable over claim 26 of '215 in view of Bookbinder because both claims recite that the modified PH20 polypeptide exhibits increased hyaluronidase activity compared to the hyaluronidase activity of the polypeptide set forth in SEQ ID NO: 3, measured under identical conditions.

Instant claim 29 is unpatentable over claim 27 of '215 in view of Bookbinder because both claims recite that the modified PH20 polypeptide exhibits 120% hyaluronidase activity compared to the hyaluronidase activity of the polypeptide set forth in SEQ ID NO: 3, measured under identical conditions.

Regarding instant claims 30 and 32, claims 24-34 and 36-40 of '215 do not recite that the therapeutically active agent is a polypeptide, a protein, a nucleic acid, a drug, a small molecule, or an organic molecule. Bookbinder taught that PH20 increased delivery of small molecules, proteins, and nucleic acids less than 500 nm in size (column 8, lines 6-10). Therefore, it would have been obvious to administer the modified PH20 of claims 24-34 and 36-40 of '215 in combination with Bookbinder's therapeutic agents (such as small molecules, proteins, or nucleic acids) in order to increase delivery and the person of ordinary skill in the art would have had a reasonable expectation of success in doing so. Furthermore, it would have been obvious to administer the pharmaceutical composition of claim 35 or 37 of '215 to a subject in order to increase the delivery of small molecule drug. The person of ordinary skill in the art would have

been motivated by Bookbinder's teaching that PH20 increased delivery of small molecules, proteins, and nucleic acids less than 500 nm in size (column 8, lines 6-10) and thus the person of ordinary skill in the art would have also had a reasonable expectation of success.

Instant claim 33 is unpatentable over claim 38 of '215 in view of Bookbinder because both claims are drawn to methods of administering a pharmaceutical composition comprising the modified PH20 hyaluronidase and a therapeutically active agent parenterally.

Instant claim 34 is unpatentable over claim 39 of '215 in view of Bookbinder because both claims recite that the pharmaceutical composition (modified PH20 polypeptide and therapeutically effective agent) are administered subcutaneously.

Claim 31 is rejected on the ground of nonstatutory double patenting as being unpatentable over claims 24-40 of copending Application No. **18/659,215 (hereafter '215) in view of Bookbinder et al. (US 7,767,429 B2)**, as applied to claims 24-25, 28-30, and 32-34 above, and **as evidenced by Reth** (*Nat Immunol* 14, 765–767 (2013)).

See discussion of claims 24-40 of '215 and Bookbinder above, which is incorporated into this rejection as well.

Regarding instant claim 31, claim 36 of '215 recites that the therapeutically active agent is an antibody but does not recite a method for increasing delivery of the therapeutic agent.

It would have been obvious to a person of ordinary skill in the art before the effective filing date of the claimed invention to administer the pharmaceutical

composition of claim 36 of '215 in order to increase delivery of the therapeutic molecule per Bookbinder's teaching. The person of ordinary skill in the art would have had a reasonable expectation of success given that Bookbinder taught that soluble hyaluronidase facilitated diffusion of small molecules, proteins, and nucleic acids and the modified PH20 of claims 24-40 of '215 was both soluble (see claim 24 of '215) and exhibited hyaluronidase activity (see claim 26 of '215). Bookbinder also taught that soluble hyaluronidases open channels in the interstitial space through degradation of glycosaminoglycans (column 8, lines 2-5) and that these channels facilitate the diffusion of small molecules, proteins, and nucleic acids less than 500 nm in size (column 8, lines 6-10). Antibodies are less than 500 nm in size, as evidenced by Reth (see page 765, second column, top paragraph: "The real size of an antibody molecule is about 10 nm"). Therefore, the person of ordinary skill in the art would have had a reasonable expectation of success in increasing delivery of the antibody in the pharmaceutical composition of claim 36 of '215. Similarly, it would have been obvious to the person of ordinary skill in the art before the effective filing date of the claimed invention to combine the modified PH20 polypeptide of any of claims 24-35 or 37-40 of '215 with an antibody for increased delivery of the antibody given that Bookbinder suggested that soluble hyaluronidase increased diffusion of proteins less than 500 nm in size (column 8, lines 6-10).

Allowable Subject Matter

Claims 26-27 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to CANDICE LEE SWIFT whose telephone number is (571)272-0177. The examiner can normally be reached M-F 8:00 AM-4:30 PM (Eastern).

Examiner interviews are available via telephone, in-person, and video conferencing using a USPTO supplied web-based collaboration tool. To schedule an interview, applicant is encouraged to use the USPTO Automated Interview Request (AIR) at <http://www.uspto.gov/interviewpractice>.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Louise Humphrey can be reached on (571)272-5543. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Title of Invention

PH20 POLYPEPTIDE VARIANTS, FORMULATIONS AND USES THEREOF

Filing of terminal disclaimer does not obviate requirement for response under 37 CFR 1.111 to outstanding Office Action

This electronic Terminal Disclaimer is not being used for a Joint Research Agreement.

Owner	Percent interest
Halozyne, Inc.	100%
Total	100%

The owner(s) of percent interest listed above in the instant application hereby disclaims, except as provided below, the terminal part of the statutory term of any patent granted on the instant application which would extend beyond the expiration date of the full statutory term of any patent granted on pending reference Application Number(s)

Application #	Filing Date
18659215	05/09/2024

as the term of any patent granted on said reference application may be shortened by any terminal disclaimer filed prior to the grant of any patent on the pending reference application. The owner hereby agrees that any patent so granted on the instant application shall be enforceable only for and during such period that it and any patent

granted on the reference application are commonly owned. This agreement runs with any patent granted on the instant application and is binding upon the grantee, its successors or assigns.

In making the above disclaimer, the owner does not disclaim the terminal part of any patent granted on the instant application that would extend to the expiration date of the full statutory term of any patent granted on said reference application, "as the term of any patent granted on said reference application may be shortened by any terminal disclaimer filed prior to the grant of any patent on the pending reference application," in the event that any such patent granted on the pending reference application: expires for failure to pay a maintenance fee, is held unenforceable, is found invalid by a court of competent jurisdiction, is statutorily disclaimed in whole or terminally disclaimed under 37 CFR 1.321, has all claims canceled by a reexamination certificate, is reissued, or is in any manner terminated prior to the expiration of its full statutory term as shortened by any terminal disclaimer filed prior to its grant.

The owner(s) of percent interest listed above in the instant application hereby disclaims, except as provided below, the terminal part of the statutory term of any patent granted on the instant application which would extend beyond the expiration date of the full statutory term of prior patent number(s)

Patent #

as the term of said prior patent is presently shortened by any terminal disclaimer. The owner hereby agrees that any patent so granted on the instant application shall be enforceable only for and during such period that it and the prior patent are commonly owned. This agreement runs with any patent granted on the instant application and is binding upon the grantee, its successors or assigns.

In making the above disclaimer, the owner does not disclaim the terminal part of the term of any patent granted on the instant application that would extend to the expiration date of the full statutory term of the prior patent, "as the term of said prior patent is presently shortened by any terminal disclaimer," in the event that said prior patent later:

- expires for failure to pay a maintenance fee;
- is held unenforceable;
- is found invalid by a court of competent jurisdiction;
- is statutorily disclaimed in whole or terminally disclaimed under 37 CFR 1.321;
- has all claims canceled by a reexamination certificate;
- is reissued; or
- is in any manner terminated prior to the expiration of its full statutory term as presently shortened by any terminal disclaimer.

Terminal disclaimer fee under 37 CFR 1.20(d) included with Electronic Terminal Disclaimer request.

Applicant claims the following entity status:

Regular Undiscounted

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

I certify, in accordance with 37 CFR 1.4(d)(4) that I am: An attorney or agent registered to practice before the Patent and Trademark Office who is of record in this application

Signature	Name	Registration #
/Kalpesh V. Upadhye/	Kalpesh Upadhye	70236

* Statement under 37 CFR 3.73(b) is required if terminal disclaimer is signed by the assignee (owner). Form PTO/SB/96 may be used for making this certification. See MPEP 324.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

AMENDMENT UNDER 37 C.F.R. § 1.111

In response to the Office Action dated 07/15/2024, Applicant requests entry of the following amendments and remarks. This response is considered timely filed. To the extent any additional fee is due, the Director is hereby authorized to charge additional fees which may be required, or credit any overpayment, to Deposit Account No. 50-0310.

Listing of the Claims begin on page 2 of this paper.

Remarks begin on page 4 of this paper.

AMENDMENTS TO CLAIMS

This Listing of Claims will replace all prior versions.

1- 23. (Cancelled)

24. (Currently amended) A method for increasing delivery of a therapeutic agent to a subject, comprising administering to a subject a pharmaceutical composition comprising:

(a) a therapeutic agent; and

(b) a modified PH20 polypeptide comprising an amino acid sequence, wherein:

- i. at least 95% of the residues of the amino acid sequence of the modified PH20 polypeptide are identical to the residues in an amino acid sequence selected from the group consisting of SEQ ID NOs: 3 and 32-66 when the sequence of the modified PH20 polypeptide is aligned at positions corresponding to the sequence selected from the group consisting of SEQ ID NOs: 3 and 32-66 to maximize identical residues; and
- ii. the amino acid sequence of the modified PH20 polypeptide comprises an amino acid modification at a position corresponding to position 320 with reference to amino acid positions set forth in SEQ ID NO: 3; and
- iii. the modification at position 320 is a replacement selected from the group consisting of H, K, ~~R~~ and R and S.

25. (Previously presented) The method of Claim 24, wherein the amino acid modification is at a position corresponding to position 320 with reference to amino acid positions set forth in SEQ ID NO: 3 is K.

26. (Previously presented) The method of Claim 25, wherein at least 96% of the residues of the amino acid sequence of the modified PH20 polypeptide are identical to the residues in an amino acid sequence set forth in SEQ ID NO:35.

27. (Previously presented) The method of Claim 25, wherein at least 95% of the residues of the amino acid sequence of the modified PH20 polypeptide are identical to the residues in an amino acid sequence set forth in SEQ ID NO:32.

28. (Previously presented) The method of Claim 24, wherein the modified PH20 polypeptide exhibits increased hyaluronidase activity compared to the hyaluronidase activity of the polypeptide set forth in SEQ ID NO: 3, measured under identical conditions.

29. (Previously presented) The method of Claim 24, wherein the hyaluronidase activity of the modified PH20 polypeptide is at least 120% of the hyaluronidase activity of the PH20 polypeptide of SEQ ID NO: 3, measured under identical condition.
30. (Currently amended) The method of Claim 24, wherein the ~~therapeutically active~~ therapeutic agent is a polypeptide, a protein, a nucleic acid, a drug, a small molecule, or an organic molecule.
31. (Currently amended) The method of Claim 24, wherein the ~~therapeutically active~~ therapeutic agent is an antibody.
32. (Currently amended) The method of Claim 24, wherein the ~~therapeutically active~~ therapeutic agent is a small molecule drug.
33. (Previously presented) The method of Claim 24, wherein the pharmaceutical composition is administered to the patient parenterally.
34. (Previously presented) The method of Claim 24, wherein the pharmaceutical composition is administered to the patient subcutaneously.

REMARKS

Claims 24-34 are pending in this application of which claim 24 is independent. Claim 24 has been amended herein for formality. Applicant submits that no prohibited new matter has been added by way of the amendments.

The arguments and contentions presented in the Office Action should not be construed as any acquiescence or agreement by Applicant with the stated reasoning therein regardless of whether or not the following remarks specifically address any particular argument or contention from the Office Action. Furthermore, although certain distinctions between the claims of the present application and the cited references are addressed below, these distinctions are not necessarily exhaustive.

Rejection under 35 U.S.C. § 112

Claims 30-32 are rejected under 35 U.S.C. § 112, second paragraph (pre-AIA) as allegedly being indefinite as set forth in the Office Action at page 3. Without acquiescing to the propriety of the rejection, and solely in an effort to expedite prosecution, Applicant has amended claims 30-32 in accordance with the Examiner's suggestions. Withdrawal of the rejection is requested in view of the amendments.

Double Patenting Rejections

Claims 24-25, 28-30, and 32-34 are rejected on the ground of non-statutory double patenting as being unpatentable over claims 24-40 of copending U.S. Patent Application No. 18/659,215 (the '215 Application) in view of US Patent No. 7,767,429 ("Bookbinder") as set forth in the Office Action at pages 5-8.

Claim 31 is rejected on the ground of non-statutory double patenting as being unpatentable over claims 24-40 of copending U.S. Patent Application No. 18/659,215 (the '215 Application) in view of US Patent No. 7,767,429 ("Bookbinder") and as evidenced by *Nat. Immunol.* 14, 765-767 (2013) ("Reth"), as set forth in the Office Action at pages 8-9.

Applicant herewith submits a terminal disclaimer obviating the double patenting rejections over the '215 Application. Withdrawal of the double patenting rejections is requested in view of the terminal disclaimer.

Conclusion

The foregoing amendments and remarks are being submitted to place the subject application in condition for allowance. Should an interview be helpful to further prosecution of this application, the Examiner is invited to telephone the undersigned.

Respectfully submitted,

MORGAN LEWIS & BOCKIUS LLP

EXAMINER

SWIFT, CANDICE LEE

ART UNIT

PAPER NUMBER

1657

DATE MAILED: 08/20/2024

APPLICATION NO.	FILING DATE	FIRST NAMED INVENTOR	ATTORNEY DOCKET NO.	CONFIRMATION NO.
18/599,428	03/08/2024	Ge WEI	63995-01-5105-US18	3348

TITLE OF INVENTION: PH20 POLYPEPTIDE VARIANTS, FORMULATIONS AND USES THEREOF

APPLN. TYPE	ENTITY STATUS	ISSUE FEE DUE	PUBLICATION FEE DUE	PREV. PAID ISSUE FEE	TOTAL FEE(S) DUE	DATE DUE
nonprovisional	UNDISCOUNTED	\$1200	\$0.00	\$0.00	\$1200	11/20/2024

THE APPLICATION IDENTIFIED ABOVE HAS BEEN EXAMINED AND IS ALLOWED FOR ISSUANCE AS A PATENT. PROSECUTION ON THE MERITS IS CLOSED. THIS NOTICE OF ALLOWANCE IS NOT A GRANT OF PATENT RIGHTS. THIS APPLICATION IS SUBJECT TO WITHDRAWAL FROM ISSUE AT THE INITIATIVE OF THE OFFICE OR UPON PETITION BY THE APPLICANT. SEE 37 CFR 1.313 AND MPEP 1308.

THE ISSUE FEE AND PUBLICATION FEE (IF REQUIRED) MUST BE PAID WITHIN THREE MONTHS FROM THE MAILING DATE OF THIS NOTICE OR THIS APPLICATION SHALL BE REGARDED AS ABANDONED. THIS STATUTORY PERIOD CANNOT BE EXTENDED. SEE 35 U.S.C. 151. THE ISSUE FEE DUE INDICATED ABOVE DOES NOT REFLECT A CREDIT FOR ANY PREVIOUSLY PAID ISSUE FEE IN THIS APPLICATION. IF AN ISSUE FEE HAS PREVIOUSLY BEEN PAID IN THIS APPLICATION (AS SHOWN ABOVE), THE RETURN OF PART B OF THIS FORM WILL BE CONSIDERED A REQUEST TO REAPPLY THE PREVIOUSLY PAID ISSUE FEE TOWARD THE ISSUE FEE NOW DUE.

HOW TO REPLY TO THIS NOTICE:

I. Review the ENTITY STATUS shown above. If the ENTITY STATUS is shown as SMALL or MICRO, verify whether entitlement to that entity status still applies.

If the ENTITY STATUS is the same as shown above, pay the TOTAL FEE(S) DUE shown above.

If the ENTITY STATUS is changed from that shown above, on PART B - FEE(S) TRANSMITTAL, complete section number 5 titled "Change in Entity Status (from status indicated above)".

For purposes of this notice, small entity fees are 40% the amount of undiscounted fees, and micro entity fees are 20% the amount of undiscounted fees.

II. PART B - FEE(S) TRANSMITTAL, or its equivalent, must be completed and returned to the United States Patent and Trademark Office (USPTO) with your ISSUE FEE and PUBLICATION FEE (if required). If you are charging the fee(s) to your deposit account, section "4b" of Part B - Fee(s) Transmittal should be completed. If an equivalent of Part B is filed, a request to reapply a previously paid issue fee must be clearly made, and delays in processing may occur due to the difficulty in recognizing the paper as an equivalent of Part B.

III. All communications regarding this application must give the application number. Please direct all communications prior to issuance to Mail Stop ISSUE FEE unless advised to the contrary.

IMPORTANT REMINDER: Maintenance fees are due in utility patents issuing on applications filed on or after Dec. 12, 1980. It is patentee's responsibility to ensure timely payment of maintenance fees when due. More information is available at www.uspto.gov/PatentMaintenanceFees.

PART B - FEE(S) TRANSMITTAL

Complete and send this form, together with applicable fee(s), by mail or fax, or via the USPTO patent electronic filing system.

By mail, send to: Mail Stop ISSUE FEE
Commissioner for Patents
P.O. Box 1450
Alexandria, Virginia 22313-1450

By fax, send to: (571)-273-2885

INSTRUCTIONS: This form should be used for transmitting the ISSUE FEE and PUBLICATION FEE (if required). Blocks 1 through 5 should be completed where appropriate. All further correspondence will be mailed to the current correspondence address as indicated unless corrected below or directed otherwise in Block 1, by (a) specifying a new correspondence address; and/or (b) indicating a separate "FEE ADDRESS" for maintenance fee notifications. **Because electronic patent issuance may occur shortly after issue fee payment, any desired continuing application should preferably be filed prior to payment of this issue fee in order not to jeopardize copendency.**

CURRENT CORRESPONDENCE ADDRESS (Note: Use Block 1 for any change of address)

28977 7590 08/20/2024
Morgan, Lewis & Bockius LLP (PH)
2222 Market Street
Philadelphia, PA 19103

Note: A certificate of mailing can only be used for domestic mailings of the Fee(s) Transmittal. This certificate cannot be used for any other accompanying papers. Each additional paper, such as an assignment or formal drawing, must have its own certificate of mailing or transmission.

Certificate of Mailing or Transmission

I hereby certify that this Fee(s) Transmittal is being deposited with the United States Postal Service with sufficient postage for first class mail in an envelope addressed to the Mail Stop ISSUE FEE address above, or being transmitted to the USPTO via the USPTO patent electronic filing system or by facsimile to (571) 273-2885, on the date below.

1. Change of correspondence address or indication of "Fee Address" (37 CFR 1.363).

☐ Change of correspondence address (or Change of Correspondence Address form PTO/AIA/122 or PTO/SB/122) attached.

☐ "Fee Address" indication (or "Fee Address" Indication form PTO/AIA/47 or PTO/SB/47; Rev 03-02 or more recent) attached. **Use of a Customer Number is required.**

2. For printing on the patent front page, list

(1) The names of up to 3 registered patent attorneys or agents OR, alternatively,

1 _____

(2) The name of a single firm (having as a member a registered attorney or agent) and the names of up to 2 registered patent attorneys or agents. If no name is listed, no name will be printed.

2 _____

3 _____

3. ASSIGNEE NAME AND RESIDENCE DATA TO BE PRINTED ON THE PATENT (print or type)

PLEASE NOTE: Unless an assignee is identified below, no assignee data will appear on the patent. If an assignee is identified below, the document must have been previously recorded, or filed for recordation, as set forth in 37 CFR 3.11 and 37 CFR 3.81(a). Completion of this form is NOT a substitute for filing an assignment.

(A) NAME OF ASSIGNEE

(B) RESIDENCE: (CITY and STATE OR COUNTRY)

Please check the appropriate assignee category or categories (will not be printed on the patent): ☐ Individual ☐ Corporation or other private group entity ☐ Government4a. Fees submitted: ☐ Issue Fee ☐ Publication Fee (if required)

4b. Method of Payment: (Please first reapply any previously paid fee shown above)

☐ Electronic Payment via the USPTO patent electronic filing system ☐ Enclosed check ☐ Non-electronic payment by credit card (Attach form PTO-2038)☐ The Director is hereby authorized to charge the required fee(s), any deficiency, or credit any overpayment to Deposit Account No. _____

5. Change in Entity Status (from status indicated above)

☐ Applicant certifying micro entity status. See 37 CFR 1.29☐ Applicant asserting small entity status. See 37 CFR 1.27☐ Applicant changing to regular undiscounted fee status.

NOTE: Absent a valid certification of Micro Entity Status (see forms PTO/SB/15A and 15B), issue fee payment in the micro entity amount will not be accepted at the risk of application abandonment.

NOTE: If the application was previously under micro entity status, checking this box will be taken to be a notification of loss of entitlement to micro entity status.

NOTE: Checking this box will be taken to be a notification of loss of entitlement to small or micro entity status, as applicable.

NOTE: This form must be signed in accordance with 37 CFR 1.31 and 1.33. See 37 CFR 1.4 for signature requirements and certifications.

Determination of Patent Term Adjustment under 35 U.S.C. 154 (b) (Applications filed on or after May 29, 2000)

The Office has discontinued providing a Patent Term Adjustment (PTA) calculation with the Notice of Allowance.

Section 1(h)(2) of the AIA Technical Corrections Act amended 35 U.S.C. 154(b)(3)(B)(i) to eliminate the requirement that the Office provide a patent term adjustment determination with the notice of allowance. See Revisions to Patent Term Adjustment, 78 Fed. Reg. 19416, 19417 (Apr. 1, 2013). Therefore, the Office is no longer providing an initial patent term adjustment determination with the notice of allowance. The Office will continue to provide a patent term adjustment determination with the Issue Notification Letter that is mailed to applicant approximately three weeks prior to the issue date of the patent, and will include the patent term adjustment on the patent. Any request for reconsideration of the patent term adjustment determination (or reinstatement of patent term adjustment) should follow the process outlined in 37 CFR 1.705.

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (571)-272-7702. Questions relating to issue and publication fee payments should be directed to the Customer Service Center of the Office of Patent Publication at 1-(888)-786-0101 or (571)-272-4200.

OMB Clearance and PRA Burden Statement for PTOL-85 Part B

The Paperwork Reduction Act (PRA) of 1995 requires Federal agencies to obtain Office of Management and Budget approval before requesting most types of information from the public. When OMB approves an agency request to collect information from the public, OMB (i) provides a valid OMB Control Number and expiration date for the agency to display on the instrument that will be used to collect the information and (ii) requires the agency to inform the public about the OMB Control Number's legal significance in accordance with 5 CFR 1320.5(b).

The information collected by PTOL-85 Part B is required by 37 CFR 1.311. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 30 minutes to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, Virginia 22313-1450. **DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, Virginia 22313-1450.** Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number.

Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. The United States Patent and Trademark Office (USPTO) collects the information in this record under authority of 35 U.S.C. 2. The USPTO's system of records is used to manage all applicant and owner information including name, citizenship, residence, post office address, and other information with respect to inventors and their legal representatives pertaining to the applicant's/owner's activities in connection with the invention for which a patent is sought or has been granted. The applicable Privacy Act System of Records Notice for the information collected in this form is COMMERCE/PAT-TM-7 Patent Application Files, available in the Federal Register at 78 FR 19243 (March 29, 2013).

<https://www.govinfo.gov/content/pkg/FR-2013-03-29/pdf/2013-07341.pdf>

Routine uses of the information in this record may include disclosure to:

- 1) law enforcement, in the event that the system of records indicates a violation or potential violation of law;
- 2) a federal, state, local, or international agency, in response to its request;
- 3) a contractor of the USPTO having need for the information in order to perform a contract;
- 4) the Department of Justice for determination of whether the Freedom of Information Act (FOIA) requires disclosure of the record;
- 5) a Member of Congress submitting a request involving an individual to whom the record pertains, when the individual has requested the Member's assistance with respect to the subject matter of the record;
- 6) a court, magistrate, or administrative tribunal, in the course of presenting evidence, including disclosures to opposing counsel in the course of settlement negotiations;
- 7) the Administrator, General Services Administration (GSA), or their designee, during an inspection of records conducted by GSA under authority of 44 U.S.C. 2904 and 2906, in accordance with the GSA regulations and any other relevant (i.e., GSA or Commerce) directive, where such disclosure shall not be used to make determinations about individuals;
- 8) another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c));
- 9) the Office of Personnel Management (OPM) for personnel research purposes; and
- 10) the Office of Management and Budget (OMB) for legislative coordination and clearance.

If you do not furnish the information requested on this form, the USPTO may not be able to process and/or examine your submission, which may result in termination of proceedings, abandonment of the application, and/or expiration of the patent.

Notice of Allowability	Application No. 18/599,428	Applicant(s) WEI et al.	
	Examiner CANDICE L SWIFT	Art Unit 1657	AIA (FITF) Status No

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address--

All claims being allowable, PROSECUTION ON THE MERITS IS (OR REMAINS) CLOSED in this application. If not included herewith (or previously mailed), a Notice of Allowance (PTOL-85) or other appropriate communication will be mailed in due course. **THIS NOTICE OF ALLOWABILITY IS NOT A GRANT OF PATENT RIGHTS.** This application is subject to withdrawal from issue at the initiative of the Office or upon petition by the applicant. See 37 CFR 1.313 and MPEP 1308.

1. ☒ This communication is responsive to the amendment filed on 7/25/2024.
☐ A declaration(s)/affidavit(s) under **37 CFR 1.130(b)** was/were filed on _____.
2. ☐ An election was made by the applicant in response to a restriction requirement set forth during the interview on _____; the restriction requirement and election have been incorporated into this action.
3. ☒ The allowed claim(s) is/are 24-34 . As a result of the allowed claim(s), you may be eligible to benefit from the **Patent Prosecution Highway** program at a participating intellectual property office for the corresponding application. For more information, please see http://www.uspto.gov/patents/init_events/pph/index.jsp or send an inquiry to PPHfeedback@uspto.gov.
4. ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
Certified copies:
a) ☐ All b) ☐ Some* c) ☐ None of the:
1. ☐ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this national stage application from the International Bureau (PCT Rule 17.2(a)).
* Certified copies not received: _____.

Applicant has THREE MONTHS FROM THE "MAILING DATE" of this communication to file a reply complying with the requirements noted below. Failure to timely comply will result in ABANDONMENT of this application.
THIS THREE-MONTH PERIOD IS NOT EXTENDABLE.

5. ☐ CORRECTED DRAWINGS (as "replacement sheets") must be submitted.
☐ including changes required by the attached Examiner's Amendment / Comment or in the Office action of Paper No./Mail Date _____.
Identifying indicia such as the application number (see 37 CFR 1.84(c)) should be written on the drawings in the front (not the back) of each sheet. Replacement sheet(s) should be labeled as such in the header according to 37 CFR 1.121(d).
6. ☐ DEPOSIT OF and/or INFORMATION about the deposit of BIOLOGICAL MATERIAL must be submitted. Note the attached Examiner's comment regarding REQUIREMENT FOR THE DEPOSIT OF BIOLOGICAL MATERIAL.

Attachment(s)

1. <input type="checkbox"/> Notice of References Cited (PTO-892) 2. <input type="checkbox"/> Information Disclosure Statements (PTO/SB/08), Paper No./Mail Date _____. 3. <input type="checkbox"/> Examiner's Comment Regarding Requirement for Deposit of Biological Material _____. 4. <input type="checkbox"/> Interview Summary (PTO-413), Paper No./Mail Date _____.	5. <input type="checkbox"/> Examiner's Amendment/Comment 6. <input checked="" type="checkbox"/> Examiner's Statement of Reasons for Allowance 7. <input type="checkbox"/> Other _____.

--	---

DETAILED ACTION

Notice of Pre-AIA or AIA Status

The present application is being examined under the pre-AIA first to invent provisions.

Response to Amendment

The rejection of claims 30-32 under 35 U.S.C. 112(b) is withdrawn in view of Applicant's amendment.

The obviousness-type nonstatutory double patenting rejections of record over claims 24-34 of U.S. Patent Application No. 18/659,215 in view of Bookbinder are withdrawn in view of Applicant's approved terminal disclaimer.

Allowable Subject Matter

Claims 24-34 are allowed.

The following is an examiner's statement of reasons for allowance:

the prior art does not teach a modified PH20 polypeptide with at least 95% of the residues of the amino acid sequence of the modified PH20 polypeptide identical to the residues in the amino acid sequence selected from the group consisting of SEQ ID NO: 3 and 32-66, wherein the amino acid sequence of the modified PH20 polypeptide comprises an amino acid modification at a position corresponding to position 320 with reference to amino acid positions set forth in SEQ ID NO: 3, wherein the modification at position 320 is a replacement selected from among H, K, R, and S. Therefore, the

instant claims, which are drawn to a method of use of the modified PH20 polypeptide, are allowable over the prior art.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to CANDICE LEE SWIFT whose telephone number is (571)272-0177. The examiner can normally be reached M-F 8:00 AM-4:30 PM (Eastern).

Examiner interviews are available via telephone, in-person, and video conferencing using a USPTO supplied web-based collaboration tool. To schedule an interview, applicant is encouraged to use the USPTO Automated Interview Request (AIR) at <http://www.uspto.gov/interviewpractice>.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Louise Humphrey can be reached on (571)272-5543. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

PART B - FEE(S) TRANSMITTAL

Complete and send this form, together with applicable fee(s), by mail or fax, or via the USPTO patent electronic filing system.

By mail, send to: Mail Stop ISSUE FEE
Commissioner for Patents
P.O. Box 1450
Alexandria, Virginia 22313-1450

By fax, send to: (571)-273-2885

INSTRUCTIONS: This form should be used for transmitting the ISSUE FEE and PUBLICATION FEE (if required). Blocks 1 through 5 should be completed where appropriate. All further correspondence will be mailed to the current correspondence address as indicated unless corrected below or directed otherwise in Block 1, by (a) specifying a new correspondence address; and/or (b) indicating a separate "FEE ADDRESS" for maintenance fee notifications. **Because electronic patent issuance may occur shortly after issue fee payment, any desired continuing application should preferably be filed prior to payment of this issue fee in order not to jeopardize copendency.**

CURRENT CORRESPONDENCE ADDRESS (Note: Use Block 1 for any change of address)

28977 7590 08/20/2024
Morgan, Lewis & Bockius LLP (PH)
2222 Market Street
Philadelphia, PA 19103

Note: A certificate of mailing can only be used for domestic mailings of the Fee(s) Transmittal. This certificate cannot be used for any other accompanying papers. Each additional paper, such as an assignment or formal drawing, must have its own certificate of mailing or transmission.

Certificate of Mailing or Transmission

I hereby certify that this Fee(s) Transmittal is being deposited with the United States Postal Service with sufficient postage for first class mail in an envelope addressed to the Mail Stop ISSUE FEE address above, or being transmitted to the USPTO via the USPTO patent electronic filing system or by facsimile to (571) 273-2885, on the date below.

ISSUE NOTIFICATION

The projected patent number and issue date are specified above. The patent will issue electronically. The electronically issued patent is the official patent grant pursuant to 35 U.S.C. § 153. The patent may be accessed on or after the issue date through Patent Center at <https://patentcenter.uspto.gov/>. The patent will be available in both the public and the private sides of Patent Center. Further assistance in electronically accessing the patent, or about Patent Center, is available by calling the Patent Electronic Business Center at 1-888-217-9197.

The USPTO is implementing electronic patent issuance with a transition period, during which period the USPTO will mail a ceremonial paper copy of the electronic patent grant to the correspondence address of record. Additional copies of the patent (i.e., certified and presentation copies) may be ordered for a fee from the USPTO's Certified Copy Center at <https://certifiedcopycenter.uspto.gov/index.html>. The Certified Copy Center may be reached at (800)972-6382.

Determination of Patent Term Adjustment under 35 U.S.C. 154 (b) (application filed on or after May 29, 2000)

The Patent Term Adjustment is 0 day(s). Any patent to issue from the above-identified application will include an indication of the adjustment on the front page.

If a Continued Prosecution Application (CPA) was filed in the above-identified application, the filing date that determines Patent Term Adjustment is the filing date of the most recent CPA.

Applicant will be able to obtain more detailed information by accessing the Patent Center (<https://patentcenter.uspto.gov>).

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (571)-272-7702. Questions relating to issue and publication fee payments should be directed to the Application Assistance Unit (AAU) of the Office of Patents Stakeholder Experience (OPSE), Stakeholder Support Division (SSD) at (571)-272-4200.
