#### (57) ABSTRACT

A fuel selector for use with a dual fuel generator includes a selector plate, a first fuel valve assembly positioned adjacent the selector plate and actuatable between an ON position and an OFF position to selectively control a first fuel flow to an engine of the dual fuel generator, and a second fuel valve assembly positioned adjacent the selector plate and actuatable between an ON position and an OFF position to selectively control a second fuel valve assembly control a second fuel flow to the engine of the dual fuel generator. A selector switch coupled to the selector plate is linearly translatable from a first position to a second position, so as to enable positioning of only one of the first fuel valve assembly and the second fuel valve assembly in the ON position at a given time, such that the first and second fuel valve assemblies cannot be in the ON position concurrently.

### DUAL FUEL SELECTOR SWITCH

#### BACKGROUND OF THE INVENTION

Embodiments of the invention relate generally to dual fuel <sup>5</sup> generators and, more particularly, to a selector switch for use on a dual fuel generator that is configured to ensure that only one type of fuel may be in use at a given time in the generator.

Engine-driven, electrical generators are used in a wide <sup>10</sup> variety of applications. Typically, an electrical generator utilizes a single driving engine directly coupled to a generator or alternator through a common shaft. Upon activation of the generator, a fuel and air mixture is provided to the combustion chambers of corresponding cylinders of the <sup>15</sup> engine. The fuel mixture in each combustion chamber is ignited causing an explosion within the cylinders. The explosive forces within the combustion chambers in the cylinders cause linear motion of the pistons within their corresponding cylinders. The linear motion of the pistons is <sup>20</sup> converted into rotational motion by a crankshaft that, in turn, drives the alternator. As is conventional, the driven alternator generates electrical power.

Certain generators are defined as "dual fuel" generators that include an engine having the ability to be fueled with 25 either of two fuels, such as either gasoline or liquefied petroleum gas (LPG), for example. These "dual fuel" engines may selectively operate on gasoline or LPG as desired and controlled by an operator, such as being operated on LPG/gasoline for a first period of operation and selec- 30 tively switching over to the other of LPG/gasoline for another period of operation, with such a switching of fuels being controlled as desired by an operator. Typical dual fuel generators utilize separate valves for each fuel type, such as an LPG valve and a gasoline valve, to control flow of the 35 respective fuels to the engine. While the existence of two separate valves allows one fuel type to have its valve "on" while the other has its valve "off," there is nothing to prevent both valves from being "on" at the same time. As such, it is possible for both valves to be in the "on" position, which can 40 lead to a potentially unsafe condition resulting from the mixture of the fuels.

Therefore, it would be desirable to provide a dual fuel generator with a selector switch that would prohibit the mixing of two differing types of fuels. It would further be <sup>45</sup> desirable for such a selector switch to inhibit positioning/ actuation of the valves in such a manner that the valve for a first fuel source is prevented from being "on" when the valve for a second fuel source is "on", and vice versa.

#### BRIEF DESCRIPTION OF THE INVENTION

In accordance with one aspect of the invention, a fuel selector for use with a dual fuel generator includes a selector plate, a first fuel valve assembly positioned adjacent the 55 selector plate and actuatable between an ON position and an OFF position to selectively control a first fuel flow to an engine of the dual fuel generator, and a second fuel valve assembly positioned adjacent the selector plate and actuatable between an ON position and an OFF position to 60 selectively control a second fuel flow to the engine of the dual fuel generator. The fuel selector also includes a selector switch coupled to the selector plate so as to be linearly translatable from a first position to a second position, wherein translation of the selector switch between the first 65 and second positions enables positioning of only one of the first fuel valve assembly and the second fuel valve assembly

in the ON position at a given time, such that the first and second fuel valve assemblies cannot be in the ON position concurrently.

In accordance with another aspect of the invention, a method of controlling fuel flow in a dual fuel generator includes providing a first fuel valve assembly to control fuel flow from a first fuel source to an internal combustion engine of the dual fuel generator, the first fuel valve assembly including a first fuel valve handle movable between an ON position and an OFF position to control fuel flow from the first fuel source to the internal combustion engine. The method also includes providing a second fuel valve assembly to control fuel flow from a second fuel source to the internal combustion engine of the dual fuel generator, the second fuel valve assembly including a second fuel valve handle movable between an ON position and an OFF position to control fuel flow from the second fuel source to the internal combustion engine. The method further includes providing a fuel selector switch adjacent the first fuel valve assembly and the second fuel valve assembly such that the fuel selector switch is translatable to a first position and a section position, wherein the fuel selector switch is translatable between the first position and the section position to selectively inhibit actuation of the first fuel valve handle and the second fuel valve handle, so as to prevent a simultaneous flow of fuels from the first and second fuel sources to the internal combustion engine.

In accordance with yet another aspect of the invention, a dual fuel generator includes a first fuel source, a second fuel source, and an internal combustion engine coupled to the first fuel source and the second fuel source to selectively receive fuel therefrom. The dual fuel generator also includes a fuel selector configured to control a flow of fuel from the first and second fuel sources to the internal combustion engine, with the fuel selector comprising a first fuel valve assembly including a first fuel valve and a first fuel valve handle that is actuatable between an open position and a closed position to selectively open and close the first fuel valve, a second fuel valve assembly including a second fuel valve and a second fuel valve handle that is actuatable between an open position and a closed position to selectively open and close the second fuel valve, a selector plate having the first fuel valve assembly and the second fuel valve assembly coupled to a front side thereof, and a selector switch slideably coupled to the selector plate so as to be movable from a first position to a second position. Positioning of the selector switch in the first position causes the selector switch to cover the second fuel valve handle so as to prevent the second fuel valve handle from moving to the <sup>50</sup> open position and positioning of the selector switch in the second position causes the selector switch to cover the first fuel valve handle so as to prevent the first fuel valve handle from moving to the open position.

These and other advantages and features will be more readily understood from the following detailed description of preferred embodiments of the invention that is provided in connection with the accompanying drawings.

#### BRIEF DESCRIPTION OF THE DRAWINGS

The drawings illustrate embodiments presently contemplated for carrying out the invention.

In the drawings:

FIG. 1 is a perspective view of a dual fuel generator, according to an embodiment of the invention.

FIG. **2** is a partial view of the dual fuel generator of FIG. **1**, according to an embodiment of the invention

15

FIG. **3** is a front perspective view of a fuel selector for use with the dual fuel generator of FIG. **1**, according to an embodiment of the invention.

FIG. **4** is a front perspective view of a selector switch for use with the fuel selector of FIG. **3**, according to an <sup>5</sup> embodiment of the invention.

FIG. **5** is a front perspective view of the fuel selector of FIG. **3** with the selector switch in a first position, according to an embodiment of the invention.

FIG. **6** is a front perspective view of the fuel selector of  $^{10}$  FIG. **3** with the selector switch in a second position, according to an embodiment of the invention.

#### DETAILED DESCRIPTION

Referring first to FIGS. 1 and 2, a dual fuel generator 10 is illustrated, according to an embodiment of the invention-with a perspective view of the generator 10 being shown in FIG. 1 and a more detailed partial view of the generator 10 being shown in FIG. 2 to further illustrate 20 features thereof. Dual fuel generator 10 includes an internal combustible engine 12 operatively connected to an alternator 14 in a conventional manner. The engine 12 includes pistons (not shown) that are slideably received within corresponding cylinders (not shown) thereof, with each cylin- 25 der further including an intake valve for admitting a fuel-air mixture and an exhaust valve for venting exhaust gases following combustion. The fuel-air mixture is provided by a carburetor 16 that includes a movable throttle, with a position of the throttle regulating the amount of fuel and air 30 admitted into the cylinders and thus the speed and power developed by the engine 12 when the air-fuel mixture is ignited to generate reciprocal movement of the pistons. The reciprocal movement of the pistons of engine 12 is translated to rotational movement by a crankshaft (not shown) that, in 35 turn, drives the alternator 14, so as to generate an electrical output power from the generator 10.

As the generator 10 is a dual fuel generator, the engine 12 is designed to use different fuels from either a first fuel source 18 or a second fuel source 20. In an exemplary 40 embodiment of the invention, first fuel source 18 supplies a liquefied petroleum gas (LPG) to the engine 12 and second fuel source 20 supplies gasoline to the engine 12, with the generator 10 selectively operating on LPG or gasoline as desired and controlled by an operator, such as for example 45 operating on LPG for a first period of operation and then switching over to gasoline for another period of operation. However, it is contemplated that the first fuel source 18 and/or second fuel source 20 may be other types of fuel sources (e.g., natural gas, biodiesel, etc.), according to 50 additional embodiments of the invention-and thus the scope of the invention is not meant to be limited strictly to a gasoline-LPG dual fuel embodiment.

For selectively controlling the flow of gasoline and LPG to the engine 12, dual fuel generator 10 includes a fuel 55 selector 22 constructed to provide for selection of a desired fuel source 18, 20 for supplying fuel to engine 12. The fuel selector 22 not only provides for selection of a desired fuel source 18, 20 for supplying fuel to engine 12, but also selectively restricts the selection of a fuel source so as to 60 enable the use of only one fuel at a time. As a result, fuel from first fuel source 18 cannot flow to engine 12, and vice versa.

The fuel selector 22 of generator 10 is shown in greater 65 detail in FIGS. 3-6 according to an embodiment of the invention. In general, the fuel selector 22 includes a first

4

valve assembly 24, a second valve assembly 26, a selector plate 28, a selector switch 30, and a carburetor solenoid switch 32. These elements of the fuel selector 22 collectively function to provide for selective control of a fuel flow (of gasoline or LPG) to the engine 12, with the fuel selector 22 enabling selection of a desired fuel source 18, to provide a fuel flow therefrom while also inhibiting the selection of the other fuel source 18, 20 so as to prevent a fuel flow therefrom, thereby enabling only a single fuel to flow to the engine 12 at one time.

Referring first to FIG. 3, a front view of fuel selector 22 is shown with selector switch 30 removed therefrom, so as to best illustrate the construction of the first valve assembly 24 and the second valve assembly 26. The first valve assembly 24 and the second valve assembly 26 are attached, respectively, to first fuel source 18 and second fuel source 20 to selectively control a flow of fuel from the fuel sources to the engine 12. First valve assembly 24 includes a first fuel valve handle 34 that is operatively connected to a first fuel valve. Similarly, second valve assembly 26 includes a second fuel valve handle 38 that is operatively connected to a second fuel valve 40 to control an opening and closing of the second fuel valve.

Each of the first valve assembly 24 and the second valve assembly 26 are movable between an ON position and an OFF position to control opening and closing of their respective fuel valve. More specifically, first and second fuel valve handles 34, 38 are movable between an ON position and an OFF position, with the fuel valves 36, 40 being open (to enable fuel flow to the engine 12) when their respective fuel valve handle 34, 38 is in the ON position and being closed (to prevent fuel flow to the engine 12) when their respective fuel valve handle 34, 38 is in the OFF position. Thus, when first fuel valve handle 34 is in an ON position, first fuel valve 36 is open and allows the fuel from first fuel source 18 to flow to the engine 12, and when second fuel valve handle 38 is in an ON position, second fuel valve 40 is open and allows the fuel from second fuel source 20 to flow to the engine 12.

In the preferred embodiments of the invention, first valve assembly 24 and second valve assembly 26 are located adjacent to each other on the same horizontal plane or parallel horizontal planes. In such an embodiment, first valve assembly 24 is in the ON position when first fuel valve handle 34 is moved to a vertical orientation/position and first valve assembly 24 is in an OFF position when first fuel valve handle 34 is moved to a horizontal orientation/position. Similarly, second valve assembly 26 is in the ON position when second fuel valve handle 38 is moved to a vertical orientation/position second valve assembly 26 is in an OFF position when second fuel valve handle 38 is moved to a horizontal orientation/position. It is recognized, however, that an alternative embodiment of the invention may have first valve assembly 24 and second valve assembly 26 located adjacent to each other on the same vertical plane or parallel vertical planes. One having ordinary skill in the art would recognize that in such an alternative embodiment of the invention, first and second valve assemblies 24 would be in the ON position when their respective fuel valve handles 34, 38 are horizontal, and would be in the OFF position when their respective fuel valve handles 34, 38 are vertical.

As shown in FIG. 3, first valve assembly 24 and second valve assembly 26 are positioned adjacent to the selector plate 28 of fuel selector 22. The selector plate 28 may be integrally formed as part of a larger outer frame assembly of generator 10 or may be an insert attachable to such a frame assembly. Openings 42 are formed in selector plate 28 so as

to accommodate positioning of the first valve assembly 24 and second valve assembly 26—with the openings 42 enabling positioning of first and second fuel valve handles 34, 38 in front of selector plate 28, such that they may be actuated by an operator of the generator 10 in order to 5 open/close their respective valves 36, 40. Selector plate 28 also includes slots or grooves 44 formed therein that are positioned both above and below the first and second fuel valve handles 34, 38, with the slots 44 extending generally in a lengthwise fashion along a length of the selector plate 10 28. Each of the slots 44 is configured to receive a protrusion or flange formed on selector switch 30, such that the selector switch 30 can be slideably coupled to the selector plate 28—with the selector switch 30 being translatable in a linear fashion by way of its mating with the slots 44.

Detailed views of the selector switch 30 and of its mating with the selector plate 28 are shown in FIGS. 4-6. Referring first to FIG. 4, the general structure of selector switch 30 is shown according to an exemplary embodiment. Protrusions or flanges 46 are formed on each of top and bottom surfaces 20 of the selector switch 30 that are configured to mate with the corresponding slots 44 formed in selector plate 28 (FIG. 3). The protrusions 46 may be flexible so as to accommodate coupling of the selector switch 30 to the selector plate 28. A front surface 48 of selector switch 30 includes finger-hold 25 depressions 50 formed therein that accommodate the fingers of an operator, with the finger-holds providing a convenient feature by which the operator can operate (i.e., slide) the selector switch 30. A back surface 52 of the selector switch 30 includes a groove or channel 54 formed therein having a 30 width and depth sufficient to receive the first and second fuel valve handles 34, 38 therein when in their horizontal position (i.e., the OFF position). The groove 54 is further sized and configured such that the first and second fuel valve handles 34, 38 will not fit therein when in their vertical 35 position (i.e., the ON position).

Positioning of the selector switch 30 relative to the selector plate 28 and first and second valve assemblies 24, 26 is shown in FIGS. 5 and 6. As shown therein, positioning of the first valve assembly 24 and second valve assembly 26 40 adjacent selector plate 28-and on the same horizontal plane-provides for selective positioning of the selector switch 30 relative to the fuel valve handles 34, 38 in what are generally referred to hereafter as a first position and a second position 56, 58. The selector switch 30 is translatable 45 in a horizontal motion-via a sliding motion within slots 44 of the selector plate 28—from the first position 56 (FIG. 5) to the second position 58 (FIG. 6) to selectively restrict actuation of the first and second fuel valve handles 34, 38. As the groove 54 formed in selector switch 30 is configured 50 such that the first and second fuel valve handles 34, 38 will not fit therein when in their vertical position (i.e., the ON position), it is recognized that in order to translate the selector switch 30 back and forth between the first and second positions 56, 58, both of the fuel valve handles 34, 55 38 must be in their horizontal OFF position.

In FIG. 5, selector switch 30 is illustrated in the first position 56. When selector switch 30 is in first position 56, selector switch 30 covers second fuel valve handle 38, and groove 54 formed on the back surface 52 of the fuel selector 60 switch 30 locks second fuel valve handle 38 in an OFF position, so as to prohibit the second valve assembly 26 from moving to the ON position. Further, when selector switch 30 is in first position 56, first valve assembly 24 is able to move freely between the ON position and the OFF position, with 65 the first fuel valve handle 34 being actuatable by the operator. In one embodiment of the invention, when first

valve assembly 24 is in the ON position, first fuel valve handle 34 is in a vertical position and prevents selector switch 30 from moving horizontally from first position 56 to second position 58.

In operation, when selector switch **30** is moved from second position **58** into first position **56**, second fuel valve handle **38** slides into the groove **54** formed in selector switch **30**. As a result, when selector switch **30** is in first position **56**, second fuel valve handle **38** is unable to move, as it is locked in place by groove **54**, and second valve assembly **26** is locked in the OFF position, with movement from the OFF position to the ON position being prohibited.

IN FIG. 6, selector switch 30 is illustrated in the second position 58. When selector switch 30 is in second position 58, selector switch 30 covers first fuel valve handle 34, and groove 54 formed on the back surface 52 of the fuel selector switch 30 locks first fuel valve handle 34 in an OFF position, so as to prohibit the first valve assembly 24 from moving to the ON position. In addition, when selector switch 30 is in second position 58, second valve assembly 26 is able to freely move between the ON position and the OFF position, with the second fuel valve handle 38 being actuatable by the operator. In one embodiment of the invention, when second valve assembly 26 is in a vertical position and prevents selector switch 30 from moving horizontally from second position 58 to first position 56.

In operation, when selector switch 30 is moved from first position 56 into second position 58, first fuel valve handle 34 slides into groove 54 formed in selector switch 30. Therefore, when selector switch 30 is in second position 58, first fuel valve handle 34 is unable to move, as it is locked in place by groove 54, and first valve assembly 24 is locked in the OFF position, with movement from the OFF position to the ON position being prohibited.

Referring still now to FIG. 6, according to an exemplary embodiment of the invention, the fuel selector 22 of generator 10 further comprises a carburetor solenoid switch 32 that is positioned within an opening 60 formed in selector plate 28 so as to extend therethrough and is further positioned adjacent second valve assembly 26 (i.e., second fuel valve handle 38. As solenoid switch 32 is located adjacent to the second valve assembly 26-which is in turn connected to the gasoline fuel source 20-selector switch 30 covers and triggers solenoid switch 32 when slid from the second position 58 to the first position 56—by depressing the solenoid switch 32 as it comes in contact therewith. When solenoid switch 32 is triggered, a carburetor shutoff solenoid operatively connected to the solenoid switch 32 is activated and shuts off the flow of gasoline to the carburetor 16 (FIG. 2). In the preferred embodiment of the invention, solenoid switch 32 is a depressible switch, but it is contemplated that solenoid switch 32 may be another type of switch that can be activated via interaction with selector switch 30 or via interaction with either valve handle 34, 38, so as to activate the carburetor shutoff solenoid.

Beneficially, the design of the fuel selector 22 and of the selector switch 30 described herein prevents differing fuels from two separate fuel sources from flowing to the engine of a dual fuel generator at the same time. The interaction of the selector switch 30 with the first and second fuel valve assemblies 24, 26—with the selector switch 30 sliding back and forth to selectively cover/engage first and second fuel valve assemblies 24, 26—prohibits both valve assemblies from being in the "ON" position at the same time. The selector switch 30 is thus a foolproof device that prevents the

mixing of fuels so as to provide additional safety to the usage of dual fuel generators.

Therefore, according to one embodiment of the invention, a fuel selector for use with a dual fuel generator includes a selector plate, a first fuel valve assembly positioned adjacent 5 the selector plate and actuatable between an ON position and an OFF position to selectively control a first fuel flow to an engine of the dual fuel generator, and a second fuel valve assembly positioned adjacent the selector plate and actuatable between an ON position and an OFF position to 10 selectively control a second fuel flow to the engine of the dual fuel generator. The fuel selector also includes a selector switch coupled to the selector plate so as to be linearly translatable from a first position to a second position, wherein translation of the selector switch between the first 15 and second positions enables positioning of only one of the first fuel valve assembly and the second fuel valve assembly in the ON position at a given time, such that the first and second fuel valve assemblies cannot be in the ON position concurrently.

According to another embodiment of the invention, a method of controlling fuel flow in a dual fuel generator includes providing a first fuel valve assembly to control fuel flow from a first fuel source to an internal combustion engine of the dual fuel generator, the first fuel valve assembly 25 including a first fuel valve handle movable between an ON position and an OFF position to control fuel flow from the first fuel source to the internal combustion engine. The method also includes providing a second fuel valve assembly to control fuel flow from a second fuel source to the 30 internal combustion engine of the dual fuel generator, the second fuel valve assembly including a second fuel valve handle movable between an ON position and an OFF position to control fuel flow from the second fuel source to the internal combustion engine. The method further includes 35 providing a fuel selector switch adjacent the first fuel valve assembly and the second fuel valve assembly such that the fuel selector switch is translatable to a first position and a section position, wherein the fuel selector switch is translatable between the first position and the section position to 40 selectively inhibit actuation of the first fuel valve handle and the second fuel valve handle, so as to prevent a simultaneous flow of fuels from the first and second fuel sources to the internal combustion engine.

According to yet another embodiment of the invention, a 45 dual fuel generator includes a first fuel source, a second fuel source, and an internal combustion engine coupled to the first fuel source and the second fuel source to selectively receive fuel therefrom. The dual fuel generator also includes a fuel selector configured to control a flow of fuel from the 50 first and second fuel sources to the internal combustion engine, with the fuel selector comprising a first fuel valve assembly including a first fuel valve and a first fuel valve handle that is actuatable between an open position and a closed position to selectively open and close the first fuel 55 valve, a second fuel valve assembly including a second fuel valve and a second fuel valve handle that is actuatable between an open position and a closed position to selectively open and close the second fuel valve, a selector plate having the first fuel valve assembly and the second fuel valve 60 assembly coupled to a front side thereof, and a selector switch slideably coupled to the selector plate so as to be movable from a first position to a second position. Positioning of the selector switch in the first position causes the selector switch to cover the second fuel valve handle so as 65 to prevent the second fuel valve handle from moving to the open position and positioning of the selector switch in the

second position causes the selector switch to cover the first fuel valve handle so as to prevent the first fuel valve handle from moving to the open position.

While the invention has been described in connection with only a limited number of embodiments, it should be readily understood that the invention is not limited to such disclosed embodiments. Rather, the invention can be modified to incorporate any number of variations, alterations, substitutions or equivalent arrangements not heretofore described, but which are commensurate with the spirit and scope of the invention. Additionally, while various embodiments of the invention have been described, it is to be understood that aspects of the invention may include only some of the described embodiments. Accordingly, the invention is not to be seen as limited by the foregoing description, but is only limited by the scope of the appended claims.

#### What is claimed is:

**1**. A fuel selector for use with a dual fuel generator, the <sup>20</sup> fuel selector comprising:

- a first fuel valve having open and closed positions to selectively control a first fuel flow to an engine of the dual fuel generator;
- a second fuel valve having open and closed positions to selectively control a second fuel flow to the engine of the dual fuel generator;
- a first valve handle coupled to the first fuel valve and actuatable between an ON position and an OFF position to selectively open and close the first fuel valve, respectively;
- a second valve handle coupled to the second fuel valve and actuatable between an ON position and an OFF position to selectively open and close the second fuel valve, respectively;
- a selector plate positioned adjacent the first and second valve handles; and
- a selector switch positioned adjacent the first and second fuel valves to allow a user to manually select one of the first fuel flow and the second fuel flow;
- wherein the selector switch is coupled to the selector plate so as to be movable from a first position to a second position, with movement of the selector switch between the first and second positions enabling positioning of only one of the first valve handle and the second valve handle in the ON position at a given time.

2. The fuel selector of claim 1 wherein the selector switch comprises:

a front surface and a back surface;

- a groove located in the back surface; and
- wherein the groove engages the first valve handle to lock it in an OFF position when the selector switch is in the second position; and
- wherein the groove engages the second valve handle to lock it in an OFF position when the selector switch is in the first position.

**3**. The fuel selector of claim **2** wherein the first and second valve handles have a vertical orientation when in the ON position and have a horizontal orientation when in the OFF position, with the groove being able to engage the first and second valve handles when in their horizontal orientation.

4. The fuel selector of claim 3 wherein an interaction between the groove and the first and second valve handles prevents translation of the selector switch unless both of the first and second valve handles are oriented horizontally in the OFF position.

**5**. The fuel selector of claim **1** wherein, when the selector switch is in the first position, the first fuel valve assembly is

actuatable between the ON position and the OFF position and the second fuel valve assembly is prohibited from being in the ON position; and

wherein, when the selector switch is in the second position, the first fuel valve assembly is prohibited from being in the ON position and the second fuel valve assembly is actuatable between the ON position and the OFF position.

**6**. The fuel selector of claim **1** wherein the first fuel valve assembly is attached to a liquefied petroleum gas (LPG) fuel <sup>10</sup> source; and

wherein the second fuel valve assembly is attached to a gasoline source.

7. The fuel selector of claim 1 further comprising a carburetor solenoid switch coupled to the selector plate adjacent and extending out of a front surface thereof, the carburetor solenoid switch comprising a depressible switch configured to activate an associated solenoid when depressed.

**8**. The fuel selector of claim **7** wherein when the selector switch is in the first position so as to prohibit the second fuel valve assembly from being in the ON position, the selector switch depresses the carburetor solenoid switch, so as to activate the carburetor solenoid and stop the flow of the 25 gasoline fuel source.

**9**. A method of controlling fuel flow in a dual fuel generator, the method comprising:

- providing a first fuel valve assembly to control fuel flow from a first fuel source to an internal combustion 30 engine of the dual fuel generator, the first fuel valve assembly including a first fuel valve handle movable between an ON position and an OFF position to control fuel flow from the first fuel source to the internal combustion engine; 35
- providing a second fuel valve assembly to control fuel flow from a second fuel source to the internal combustion engine of the dual fuel generator, the second fuel valve assembly including a second fuel valve handle movable between an ON position and an OFF position 40 to control fuel flow from the second fuel source to the internal combustion engine; and
- providing a fuel selector switch adjacent the first fuel valve assembly and the second fuel valve assembly such that the fuel selector switch is translatable to a first 45 position and a section position;
- wherein the fuel selector switch is translatable between the first position and the section position to selectively inhibit actuation of the first fuel valve handle and the second fuel valve handle, so as to prevent a simultaneous flow of fuels from the first and second fuel sources to the internal combustion engine.

10. The method of claim 9 wherein providing the fuel selector switch further comprises:

- positioning a selector plate adjacent the first fuel valve 55 assembly and the second fuel valve assembly; and
- coupling the fuel selector switch to the selector plate such that the fuel selector switch is slidingly engaged to the selector plate to enable translation thereof to the first position and the section position; 60
- wherein translation of the fuel selector switch to the first position allows for positioning of the first fuel valve handle in its ON position and OFF position and prevents positioning of the second fuel valve handle in its ON position; and 65
- wherein translation of the fuel selector switch to the second position allows for positioning of the second

fuel valve handle in its ON position and OFF position and prevents positioning of the first fuel valve handle in its ON position.

11. The method of claim 10 wherein translation of the fuel selector switch to the first position positions the fuel selector switch over the second fuel valve handle so as to prevent actuation thereof and translation of the fuel selector switch to the second position positions the fuel selector switch over the first fuel valve handle so as to prevent actuation thereof.

12. The method of claim 9 wherein the fuel provided by the first fuel source comprises liquefied petroleum gas (LPG) and the fuel provided by the second fuel source comprises gasoline, such that the first fuel valve assembly controls the flow of LPG to the internal combustion engine and the second fuel valve assembly controls the flow of gasoline to the internal combustion engine.

**13**. The method of claim **11** further comprising providing a carburetor solenoid shutoff switch to disable a flow of gasoline from the second fuel source to the internal com-20 bustion engine, wherein positioning of the fuel selector switch in the first position activates the carburetor solenoid shutoff switch.

14. A dual fuel generator comprising:

a first fuel source;

- a second fuel source;
- an internal combustion engine coupled to the first fuel source and the second fuel source to selectively receive fuel therefrom; and
- a fuel selector configured to control a flow of fuel from one of the first and second fuel sources to the internal combustion engine, wherein the fuel selector comprises:
  - a first fuel valve assembly including a first fuel valve and a first fuel valve handle, the first fuel valve handle being actuatable between an open position and a closed position to selectively open and close the first fuel valve;
  - a second fuel valve assembly including a second fuel valve and a second fuel valve handle, the second fuel valve handle being actuatable between an open position and a closed position to selectively open and close the second fuel valve;
  - a selector switch positioned to control actuation of the first and second fuel valve handles to selectively open and close the first and second fuel valves;
  - a selector plate to which the first fuel valve assembly and the second fuel valve assembly are coupled to a front side thereof, wherein the selector switch slideably coupled to the selector plate so as to be movable from a first position to a second position; and
  - a carburetor fuel shutoff solenoid that is activated when the selector switch is moved to the second position, when the second fuel source is being provided to the internal combustion engine;
  - wherein positioning of the selector switch in the first position causes the selector switch to cover the second fuel valve handle so as to prevent the second fuel valve handle from moving to the open position; and
  - wherein positioning of the selector switch in the second position causes the selector switch to cover the first fuel valve handle so as to prevent the first fuel valve handle from moving to the open position.

**15**. The dual fuel generator of claim **14** wherein the first fuel source is one of liquefied petroleum gas (LPG) and gasoline and the second fuel source is the other of LPG and gasoline.

16. The dual fuel generator of claim 14 wherein the selector switch comprises:

- a front side and a back side; and
- a groove located on the back side and configured to selectively engage the first fuel valve handle and the 5 second fuel valve handle;
- wherein movement of the first fuel valve handle and the second fuel valve handle to the open position is prohibited when engaged by the groove.

**17**. The dual fuel generator of claim **14** wherein an interaction between the groove and the first and second fuel valve handles prevents translation of the selector switch unless both of the first and second valve handles are in the closed position.

**18**. The dual fuel generator of claim **14** wherein the first and second valve assemblies are in the open position when <sup>15</sup> their respective valve handles are positioned vertically and the first and second valve assemblies are in the closed position when their respective valve handles are positioned horizontally.

**19**. A fuel selector for use with a dual fuel generator, the  $^{20}$  fuel selector comprising:

a first fuel valve having open and closed positions to selectively control a first fuel flow to an engine of the dual fuel generator;

- a second fuel valve having open and closed positions to selectively control a second fuel flow to the engine of the dual fuel generator;
- a selector switch positioned to control actuation of the first and second fuel valves to select one of the first fuel flow and the second fuel flow;
- a first valve handle coupled to the first fuel valve and actuatable between an ON position and an OFF position to selectively open and close the first fuel valve, respectively;
- a second valve handle coupled to the second fuel valve and actuatable between an ON position and an OFF position to selectively open and close the second fuel valve, respectively; and
- a selector plate positioned adjacent the first and second valve handles;
- wherein the selector switch is coupled to the selector plate so as to be movable from a first position to a second position, with movement of the selector switch between the first and second positions enabling positioning of only one of the first valve handle and the second valve handle in the ON position at a given time.

# UNITED STATES PATENT AND TRADEMARK OFFICE CERTIFICATE OF CORRECTION

PATENT NO.	: 9,435,273 B2
APPLICATION NO.	: 14/069747
DATED	: September 6, 2016
INVENTOR(S)	: Sarder et al.

It is certified that error appears in the above-identified patent and that said Letters Patent is hereby corrected as shown below:

In the Specification

Col. 2, line 22, delete "section position," and substitute therefore -- second position, --; and

Col. 2, line 23, delete "section position" and substitute therefore -- second position --.

Col. 4, line 6, delete "source **18**," and substitute therefore -- source **18**, **20** --.

Col. 7, line 39, delete "section position," and substitute therefore -- second position, --; and

Col. 7, line 40, delete "section position" and substitute therefore -- second position --.

In the Claims

- Col. 9, line 46 (Claim 9), delete "section position;" and substitute therefore -- second position; --; and
- Col. 9, line 48 (Claim 9), delete "section position" and substitute therefore -- second position --; and
- Col. 9, line 60 (Claim 10), delete "section position;" and substitute therefore -- second position; --.

Signed and Sealed this Fifteenth Day of November, 2016

Michelle K. Lee
