

single format or device it supports features used in other containers like AVI and MPEG, and even supports some features not implemented in mainstream codecs, such as [Variable Framerate](#). Although it hasn't been implemented yet, support for interactive menus is planned. Although there is also a [matroska](#) Video [Codec](#), it's not widely used. Common streams to find in [matroska](#) files include [MPEG-4](#) ASP (DivX, [XviD](#), [3ivX](#), etc,...) and MPEG-4 [AVC](#) (X.264) for video and [MP3](#), AC-3 (Dolby Digital), and [AAC](#) for audio.

**OGM**

OGM is a container intended to be used for codecs developed by the Xiph.Org Foundation. It's a modified version of the foundation's original [Ogg](#) container. [OGM](#) differs from [Ogg](#) in support for video and audio streams in more common formats like MPEG-4 ASP (DivX, [XviD](#), etc,...) and AC-3 (Dolby Digital).

**ASF**

ASF, which has stood for Advanced Systems Format, Advanced [Streaming](#) Format, or Active [Streaming](#) Format at various times. It's a Microsoft container used for [Windows Media](#) Video and Audio streams. [ASF](#) files may have an extension of [.ASF](#), or may use [WMA](#) or [WMV](#) denoting audio or video.

**DVR-MS**

DVR-MS is a container based on [ASF](#), but specifically modified for [Windows Media](#) Center Edition's [DVR](#) functionality. [DVR-MS](#) files support MPEG-2 video and audio, as well as AC-3 (Dolby Digital) audio. It's used almost exclusively by the various [Windows Media](#) Center Editions, although there are a few tools capable of reading, and in some cases even creating [DVR-MS](#) files.

**QuickTime**

One of the oldest containers still in use, [QuickTime](#) is used by Apple's QuickTime encoding and playback software. It uses an extension of [.MOV](#). It's also very closely related to the MP4 container, which was originally based on this container. Video streams found in QuickTime containers are generally MPEG-4 AVC, with audio typically being [AAC](#).
