Patent Health Assessment Early Access

Patent Health automatically identifies and assesses potential prosecution, maintenance, and validity issues across 70+ considerations that could impact patent enforceability and litigation strategy. This analysis flags critical defects, from maintenance fee problems to prosecution errors, that typically require days of manual review, enabling rapid assessment of patent strength and litigation risk. [Learn More](#)

Type	Severity	Assessment	Explanations
Prosecution	Major	Pending related applications	This asset has 0 open pending continuation, continuation-in-part, or divisional applications in this family. If the asset does not have any open prosecution opportunities, then all prosecution for this asset and any associated progeny is at risk in the IPR process, whereas an asset with at least one open continuation, continuation-in-part, or divisional is not.
Prosecution	Minor	No prior art search	The prosecuting agent for this asset did not appear to perform any meaningful prior art search. Oftentimes, companies avoid prior art searches to avoid the associated costs; however, such action creates greater risk of invalidity in post-grant proceedings.
