

MCX-1000

Digital Audio Server / 2003

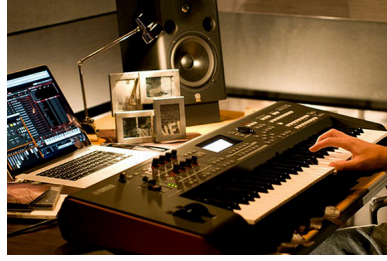

MusicCast® is a dedicated server that can distribute music to each client terminal or create original CDs. The MCX-1000 hard drive server provides for storage of roughly 100 CDs' worth of music using linear PCM which does not compromise sound quality. The system delivers music in response to a request from the client connected wirelessly (wired connection also available), and can handle different playback requests from up to seven clients. Automatic display of included song information such as album, title, and artist is also possible.
